GoodData Pandas

Release 1.1.0

GoodData Corporation

Sep 08, 2022

CONTENTS:

GoodData Pandas contains a thin layer that utilizes GoodData Python SDK and allows you to conveniently create pandas series and data frames from the computations done against semantic model in your GoodData.CN workspace.

CHAPTER

ONE

INSTALLATION

1.1 Requirements

- Python 3.7 or newer
- GoodData.CN or GoodData Cloud

1.2 Installation

Run the following command to install the `gooddata-pandas` package on your system:

```
pip install gooddata-pandas
```

CHAPTER

TWO

EXAMPLES

Here are a couple of introductory examples how to create indexed and not-indexed series and data frames:

2.1 Series

```
from gooddata_pandas import GoodPandas

# GoodData.CN host in the form of uri eg. "http://localhost:3000"
host = "http://localhost:3000"
# GoodData.CN user token
token = "some_user_token"
# initialize the adapter to work on top of GD.CN host and use the provided␣
↪authentication token
gp = GoodPandas(host, token)

workspace_id = "demo"
series = gp.series(workspace_id)

# create indexed series
indexed_series = series.indexed(index_by="label/label_id", data_by="fact/measure_id")

# create non-indexed series containing just the values of measure sliced by elements of␣
↪the label
non_indexed = series.not_indexed(data_by="fact/measure_id", granularity="label/label_id")
```

2.2 Data Frames

```
from gooddata_pandas import GoodPandas

# GoodData.CN host in the form of uri eg. "http://localhost:3000"
host = "http://localhost:3000"
# GoodData.CN user token
token = "some_user_token"
# initialize the adapter to work on top of GD.CN host and use the provided␣
↪authentication token
gp = GoodPandas(host, token)
```

(continues on next page)

(continued from previous page)

```
workspace_id = "demo"
frames = gp.data_frames(workspace_id)

# create indexed data frame
indexed_df = frames.indexed(
    index_by="label/label_id",
    columns=dict(
        first_label='label/first_label_id',
        second_label='label/second_label_id',
        first_metric='metric/first_metric_id',
        second_metric='fact/fact_id'
    )
)

# create data frame with hierarchical index
indexed_df = frames.indexed(
    index_by=dict(first_label='label/first_label_id', second_label='label/second_label_id
↪'),
    columns=dict(first_metric='metric/first_metric_id', second_metric='fact/fact_id')
)

# create non-indexed data frame
non_indexed_df = frames.not_indexed(
    columns=dict(
        first_label='label/first_label_id',
        second_label='label/second_label_id',
        first_metric='metric/first_metric_id',
        second_metric='fact/fact_id'
    )
)

# creates data frame based on the contents of the insight. if the insight contains␣
↪labels and
#  measures, the data frame will contain index or hierarchical index.
insight_df = frames.for_insight('insight_id')

# creates data frame based on the content of the items dict. if the dict contains both␣
↪labels
# and measures, the frame will contain index or hierarchical index.
df = frames.for_items(
    items=dict(
        first_label='label/first_label_id',
        second_label='label/second_label_id',
        first_metric='metric/first_metric_id',
        second_metric='fact/fact_id'
    )
)
```

CHAPTER

THREE

API

gooddata_pandas	
gooddata_sdk	The *gooddata-sdk* package aims to provide clean and convenient Python APIs to interact with GoodData.CN.

3.1 gooddata_pandas

Modules

gooddata_pandas.data_access
gooddata_pandas.dataframe
gooddata_pandas.good_pandas
gooddata_pandas.result_convertor
gooddata_pandas.series
gooddata_pandas.utils

3.1.1 gooddata_pandas.data_access

Functions

compute_and_extract(sdk, workspace_id, columns)	Convenience function to drive computation & data extraction on behalf of the series and data frame factories.

gooddata_pandas.data_access.compute_and_extract

gooddata_pandas.data_access.**compute_and_extract**(*sdk: GoodDataSdk*, *workspace_id: str*, *columns: ColumnsDef*, *index_by: Optional[IndexDef] = None*, *filter_by: Optional[Union[Filter, list[Filter]]] = None*) → tuple[dict, dict]

Convenience function to drive computation & data extraction on behalf of the series and data frame factories.

Given data columns and index columns, this function will create AFM execution and then read the results and populate data and index dicts.

For each column in *columns*, the returned data will contain key under which there is array of data for that column For each index in index_by, the returned data will contain key under which there is array with data to construct the index. When there are multiple indexes, feed the indexes to MultiIndex.from_arrays().

Note that as convenience it is possible to pass just single index. in that case the index dict will contain exactly one key of '0' (just get first value from dict when consuming the result).

Classes

ExecutionDefinitionBuilder(columns[, index_by])	

gooddata_pandas.data_access.ExecutionDefinitionBuilder

class gooddata_pandas.data_access.**ExecutionDefinitionBuilder**(*columns: Dict[str, Union[Attribute, Metric, ObjId, str]]*, *index_by: Optional[Union[Attribute, ObjId, str, Dict[str, Union[Attribute, ObjId, str]]]] = None*)

Bases: `object`

__init__(*columns: Dict[str, Union[Attribute, Metric, ObjId, str]]*, *index_by: Optional[Union[Attribute, ObjId, str, Dict[str, Union[Attribute, ObjId, str]]]] = None*) → None

Methods

__init__(columns[, index_by])	
build_execution_definition([filter_by])	

Attributes

col_to_attr_idx
col_to_metric_idx
index_to_attr_idx

3.1.2 gooddata_pandas.dataframe

Classes

DataFrameFactory(sdk, workspace_id)	Factory to create pandas.DataFrame instances.

gooddata_pandas.dataframe.DataFrameFactory

class gooddata_pandas.dataframe.**DataFrameFactory**(*sdk:* GoodDataSdk, *workspace_id: str*)

Bases: object

Factory to create pandas.DataFrame instances.

There are several methods in place that should provide for convenient construction of data frames:

- indexed() - calculate measure values sliced by one or more labels, indexed by those labels
- not_indexed() - calculate measure values sliced by one or more labels, but not indexed by those labels, label values will be part of the DataFrame and will be in the same row as the measure values calculated for them
- for_items() - calculate measure values for a one or more items which may be labels or measures. Depending what items you specify, this method will create DataFrame with or without index
- for_insight() - calculate DataFrame for insight created by GoodData.CN Analytical Designer. Depending on what items are in the insight, this method will create DataFrame with or without index.

Note that all of these methods have additional levels of convenience and flexibility so their purpose is not limited to just what is listed above.

__init__(*sdk:* GoodDataSdk, *workspace_id: str*) → None

Methods

__init__(sdk, workspace_id)	

for_exec_def(exec_def[, label_overrides, ...])	Creates a data frame using an execution definition.
for_exec_result_id(result_id[, ...])	Creates a data frame using an execution result's metadata identified by result_id.
for_insight(insight_id[, auto_index])	Creates a data frame with columns based on the content of the insight with the provided identifier.
for_items(items[, filter_by, auto_index])	Creates a data frame for a named items.
indexed(index_by, columns[, filter_by])	Creates a data frame indexed by values of the label.
not_indexed(columns[, filter_by])	Creates a data frame with columns created from metrics and or labels.

for_exec_def(*exec_def:* ExecutionDefinition, *label_overrides: Optional[Dict[str, Dict[str, Dict[str, str]]]] = None*, *result_size_limits: Tuple[Optional[int], ...] = ()*) → Tuple[DataFrame, *BareExecutionResponse*]

Creates a data frame using an execution definition. The data frame will respect the dimensionality specified in execution definition's result spec.

Each dimension may be sliced by multiple labels. The factory will create MultiIndex for the dataframe's row index and the columns.

Example of label_overrides structure:

```
{
    "labels": {
        "local_attribute_id": {
            "title": "My new attribute label"
        ,...
    },
    "metrics": {
        "local_metric_id": {
            "title": "My new metric label"
        },...
    }
}
```

Parameters

- **label_overrides** – label overrides for metrics and attributes
- **exec_def** – execution definition

Returns

a new dataframe

for_exec_result_id(*result_id: str*, *label_overrides: Optional[Dict[str, Dict[str, Dict[str, str]]]] = None*, *result_size_limits: Tuple[Optional[int], ...] = ()*) → DataFrame

Creates a data frame using an execution result's metadata identified by result_id. The data frame will respect the dimensionality specified in execution definition's result spec.

Each dimension may be sliced by multiple labels. The factory will create MultiIndex for the dataframe's row index and the columns.

Example of label_overrides structure:

```
{
    "labels": {
        "local_attribute_id": {
            "title": "My new attribute label"
        ,...
    },
    "metrics": {
        "local_metric_id": {
            "title": "My new metric label"
        },...
    }
}
```

Parameters

- **label_overrides** – label overrides for metrics and attributes
- **result_id** – executionResult ID from ExecutionResponse

Returns

a new dataframe

for_insight(*insight_id: str*, *auto_index: bool = True*) → DataFrame

Creates a data frame with columns based on the content of the insight with the provided identifier. The filters that are set on the insight will be applied and used for the server-side computation of the data for the data frame.

This method will create DataFrame with or without index - depending on the contents of the insight. The rules are as follows:

- if the insight contains both attributes and measures, it will be mapped to a DataFrame with index
  - if there are multiple attributes, hieararchical index (pandas.MultiIndex) will be used
  - otherwise a normal index will be used (pandas.Index)
  - you can use the option 'auto_index' argument to disable this logic and force no indexing
- if the insight contains either only attributes or only measures, then DataFrame will not be indexed and all attribute or measures values will be used as data.

Note that if the insight consists of single measure only, the resulting data frame is guaranteed to have single 'row' of data with one column per measure.

Parameters

- **insight_id** – insight identifier
- **auto_index** – optionally force creation of DataFrame without index even if the data in the insight is eligible for indexing

Returns

pandas dataframe instance

for_items(*items: ColumnsDef*, *filter_by: Optional[Union[*Filter*, list[*Filter*]]] = None*, *auto_index: bool = True*) → pandas.DataFrame

Creates a data frame for a named items. This is a convenience method that will create DataFrame with or without index based on the context of the items that you pass.

- If items contain labels and measures, then DataFrame with index will be created. If there is more than one label among the items, then hierarchical index will be created.

  You can turn this behavior using 'auto_index' parameter.

- Otherwise DataFrame without index will be created and will contain column per item.

You may also optionally specify filters to apply during the computation on the server.

Parameters

- **items** – dict mapping item name to its definition; item may be specified as:
  - object identifier: `ObjId(id='some_id', type='<type>')` - where type is either `label`, `fact` or `metric`
  - string representation of object identifier: `<type>/some_id` - where type is either `label`, `fact` or `metric`
  - Attribute object used in the compute model: `Attribute(local_id=..., label='some_label_id')`
  - subclass of Measure object used in the compute model: SimpleMeasure, PopDateMeasure, PopDatasetMeasure, ArithmeticMeasure
- **filter_by** – optionally specify filters to apply during computation on the server, reference to filtering column can be one of:
  - string reference to item key
  - object identifier in string form
  - object identifier: `ObjId(id='some_label_id', type='<type>')`
  - Attribute or Metric depending on type of filter

Returns

pandas dataframe instance

indexed(*index_by: IndexDef*, *columns: ColumnsDef*, *filter_by: Optional[Union[*Filter*, list[*Filter*]]] = None*) → pandas.DataFrame

Creates a data frame indexed by values of the label. The data frame columns will be created from either metrics or other label values.

The computation to obtain data from GoodData.CN workspace will use all labels that you specify for both indexing and in columns to aggregate values of metric columns.

Note that depending on composition of the labels, the DataFrame's index may or may not be unique.

Parameters

- **index_by** – one or more labels to index by; specify either:
  - string with reference to columns key - only attribute can be referenced
  - string with id: `some_label_id`,
  - string representation of object identifier: `label/some_label_id`
  - object identifier: `ObjId(id='some_label_id', type='label')`,
  - or an Attribute object used in the compute model: `Attribute(local_id=..., label='some_label_id')`,
  - dict containing mapping of index name to label to use for indexing - specified in one of the ways list above

- **columns** – dict mapping column name to its definition; column may be specified as:
  - object identifier: `ObjId(id='some_id', type='<type>')` - where type is either `label`, `fact` or `metric`
  - string representation of object identifier: `<type>/some_id` - where type is either `label`, `fact` or `metric`
  - Attribute object used in the compute model: `Attribute(local_id=..., label='some_label_id')`
  - subclass of Measure object used in the compute model: SimpleMeasure, PopDateMeasure, PopDatasetMeasure, ArithmeticMeasure
- **filter_by** – optional filters to apply during computation on the server, reference to filtering column can be one of:
  - string reference to column key or index key
  - object identifier in string form
  - object identifier: `ObjId(id='some_label_id', type='<type>')`
  - Attribute or Metric depending on type of filter

Returns
pandas dataframe instance

not_indexed(*columns: ColumnsDef*, *filter_by: Optional[Union[*Filter*, list[*Filter*]]] = None*) → pandas.DataFrame

Creates a data frame with columns created from metrics and or labels.

The computation to obtain data from GoodData.CN workspace will use all labels that you specify for both columns to aggregate values of metric columns.

Parameters

- **columns** – dict mapping column name to its definition; column may be specified as:
  - object identifier: `ObjId(id='some_id', type='<type>')` - where type is either `label`, `fact` or `metric`
  - string representation of object identifier: `<type>/some_id` - where type is either `label`, `fact` or `metric`
  - Attribute object used in the compute model: `Attribute(local_id=..., label='some_label_id')`
  - subclass of Measure object used in the compute model: SimpleMeasure, PopDateMeasure, PopDatasetMeasure, ArithmeticMeasure
- **filter_by** – optionally specify filters to apply during computation on the server, reference to filtering column can be one of:
  - string reference to column key
  - object identifier in string form
  - object identifier: `ObjId(id='some_label_id', type='<type>')`
  - Attribute or Metric depending on type of filter

Returns
pandas dataframe instance

3.1.3 gooddata_pandas.good_pandas

Module Attributes

USER_AGENT	Extra segment of the User-Agent header that will be appended to standard gooddata-sdk user agent.

gooddata_pandas.good_pandas.USER_AGENT

gooddata_pandas.good_pandas.**USER_AGENT = 'gooddata-pandas/1.1.0'**

Extra segment of the User-Agent header that will be appended to standard gooddata-sdk user agent.

Classes

GoodPandas(host, token[, headers_host])	Facade to access factories that create pandas Series and DataFrames using analytics computed by GoodData.CN.

gooddata_pandas.good_pandas.GoodPandas

class gooddata_pandas.good_pandas.**GoodPandas**(*host: str*, *token: str*, *headers_host: Optional[str] = None*)

Bases: object

Facade to access factories that create pandas Series and DataFrames using analytics computed by GoodData.CN.

__init__(*host: str*, *token: str*, *headers_host: Optional[str] = None*) → None

Methods

__init__(host, token[, headers_host])	
data_frames(workspace_id)	Creates factory to use for construction of pandas.DataFrame.
series(workspace_id)	Creates factory to use for construction of pandas.Series.

data_frames(*workspace_id: str*) → *DataFrameFactory*

Creates factory to use for construction of pandas.DataFrame.

Parameters
workspace_id – workspace to which the factory will be bound

Returns
always one same instance for given workspace

series(*workspace_id: str*) → *SeriesFactory*

Creates factory to use for construction of pandas.Series.

Parameters
workspace_id – workspace to which the factory will be bound

Returns
always one same instance for given workspace

3.1.4 gooddata_pandas.result_convertor

Functions

convert_result_to_dataframe(response, ...)	Converts execution result to a pandas dataframe, maintaining the dimensionality of the result.

gooddata_pandas.result_convertor.convert_result_to_dataframe

gooddata_pandas.result_convertor.**convert_result_to_dataframe**(*response:* BareExecutionResponse, *label_overrides: Dict[str, Dict[str, Dict[str, str]]]*, *result_size_limits: Tuple[Optional[int], ...]*) → DataFrame

Converts execution result to a pandas dataframe, maintaining the dimensionality of the result.

Because the result itself does not contain all the necessary metadata to do the full conversion, this method expects that the execution _response_.

Parameters

- **label_overrides** – label overrides
- **response** – execution response through which the result can be read and converted to a dataframe

Returns
a new dataframe

3.1.5 gooddata_pandas.series

Classes

SeriesFactory(sdk, workspace_id)	

gooddata_pandas.series.SeriesFactory

class gooddata_pandas.series.**SeriesFactory**(*sdk:* GoodDataSdk, *workspace_id: str*)

Bases: object

__init__(*sdk:* GoodDataSdk, *workspace_id: str*) → None

Methods

__init__(sdk, workspace_id)	
indexed(index_by, data_by[, filter_by])	Creates pandas Series from data points calculated from a single *data_by* that will be computed on granularity of the index labels.
not_indexed(data_by[, granularity, filter_by])	Creates pandas Series from data points calculated from a single *data_by* that will be computed on granularity of the specified labels.

indexed(*index_by: IndexDef*, *data_by: Union[*SimpleMetric*, str,* ObjId*,* Attribute*]*, *filter_by: Optional[Union[*Filter*, list[*Filter*]]] = None*) → pandas.Series

Creates pandas Series from data points calculated from a single *data_by* that will be computed on granularity of the index labels. The elements of the index labels will be used to construct simple or hierarchical index.

Parameters

- **index_by** – label to index by; specify either:
  - string with id: `some_label_id`,
  - object identifier: `ObjId(id='some_label_id', type='label')`,
  - string representation of object identifier: `label/some_label_id`
  - or an Attribute object used in the compute model: `Attribute(local_id=..., label='some_label_id')`
  - dict containing mapping of index name to label to use for indexing - specified in one of the ways list above
- **data_by** – label, fact or metric to that will provide data (metric values or label elements); specify either:
  - object identifier: `ObjId(id='some_id', type='<type>')` - where type is either `label`, `fact` or `metric`
  - string representation of object identifier: `<type>/some_id` - where type is either `label`, `fact` or `metric`
  - Attribute object used in the compute model: `Attribute(local_id=..., label='some_label_id')`
  - SimpleMetric object used in the compute model: `SimpleMetric(local_id=..., item=..., aggregation=...)`
- **filter_by** – optionally specify filter to apply during computation on the server, reference to filtering column can be one of:
  - string reference to index key

- object identifier in string form
- object identifier: `ObjId(id='some_label_id', type='<type>')`
- Attribute or Metric depending on type of filter

Returns
pandas series instance

not_indexed(*data_by: Union[SimpleMetric, str, ObjId, Attribute]*, *granularity: Union[list[LabelItemDef], IndexDef] = None*, *filter_by: Optional[Union[Filter, list[Filter]]] = None*) → pandas.Series

Creates pandas Series from data points calculated from a single *data_by* that will be computed on granularity of the specified labels. No index will be constructed.

Note that data_by may also be a label in which case the Series will contain label elements.

Parameters

- **data_by** – label, fact or metric to get data from; specify either:
  - object identifier: `ObjId(id='some_id', type='<type>')` - where type is either `label`, `fact` or `metric`
  - string representation of object identifier: `<type>/some_id` - where type is either `label`, `fact` or `metric`
  - Attribute object used in the compute model: `Attribute(local_id=..., label='some_label_id')`
  - SimpleMetric object used in the compute model: `SimpleMetric(local_id=..., item=..., aggregation=...)`
- **granularity** – optionally specify label to slice the metric by; specify either:
  - string with id: `some_label_id`,
  - object identifier: `ObjId(id='some_label_id', type='label')`,
  - string representation of object identifier: `label/some_label_id`
  - or an Attribute object used in the compute model: `Attribute(local_id=..., label='some_label_id')`
  - list containing multiple labels to slice the metric by - specified in one of the ways list above
  - dict containing mapping of index name to label to use for indexing - specified in one of the ways list above; this option is available so that you can easily switch from indexed factory method to this one if needed
- **filter_by** – optionally specify filter to apply during computation on the server, reference to filtering column can be one of:
  - object identifier in string form
  - object identifier: `ObjId(id='some_label_id', type='<type>')`
  - Attribute or Metric depending on type of filter

Returns
pandas series instance

3.1.6 gooddata_pandas.utils

Functions

make_pandas_index(index)

gooddata_pandas.utils.make_pandas_index

gooddata_pandas.utils.**make_pandas_index**(*index: dict*) → Optional[Union[Index, MultiIndex]]

Classes

DefaultInsightColumnNaming()

gooddata_pandas.utils.DefaultInsightColumnNaming

class gooddata_pandas.utils.**DefaultInsightColumnNaming**

Bases: object

__init__() → None

Methods

__init__()
col_name_for_attribute(attr)
col_name_for_metric(measure)

3.2 gooddata_sdk

The *gooddata-sdk* package aims to provide clean and convenient Python APIs to interact with GoodData.CN.

At the moment the SDK provides services to inspect and interact with the Semantic Model and consume analytics.

Modules

gooddata_sdk.catalog	
gooddata_sdk.client	Module containing a class that provides access to metadata and afm services.
gooddata_sdk.compute	
gooddata_sdk.insight	
gooddata_sdk.sdk	
gooddata_sdk.support	
gooddata_sdk.table	
gooddata_sdk.type_converter	
gooddata_sdk.utils	

3.2.1 gooddata_sdk.catalog

Modules

gooddata_sdk.catalog.base
gooddata_sdk.catalog.catalog_service_base
gooddata_sdk.catalog.data_source
gooddata_sdk.catalog.entity
gooddata_sdk.catalog.identifier
gooddata_sdk.catalog.organization
gooddata_sdk.catalog.permission
gooddata_sdk.catalog.setting
gooddata_sdk.catalog.types
gooddata_sdk.catalog.user
gooddata_sdk.catalog.workspace

gooddata_sdk.catalog.base

Functions

value_in_allowed(instance, attribute, value)	

gooddata_sdk.catalog.base.value_in_allowed

gooddata_sdk.catalog.base.**value_in_allowed**(*instance: Type[Base]*, *attribute: Attribute*, *value: str*) → None

Classes

Base()	

gooddata_sdk.catalog.base.Base

class gooddata_sdk.catalog.base.**Base**

Bases: object

__init__() → None

Method generated by attrs for class Base.

Methods

__init__()	Method generated by attrs for class Base.
client_class()	
from_api(entity)	Creates object from entity passed by client class, which represents it as dictionary.
from_dict(data[, camel_case])	Creates object from dictionary.
to_api()	
to_dict([camel_case])	Converts object into dictionary.

classmethod from_api(*entity: Dict[str, Any]*) → T

Creates object from entity passed by client class, which represents it as dictionary.

classmethod from_dict(*data: Dict[str, Any]*, *camel_case: bool = True*) → T

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake_case.

to_dict(*camel_case: bool = True*) → Dict[str, Any]

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

gooddata_sdk.catalog.catalog_service_base

Classes

CatalogServiceBase(api_client)

gooddata_sdk.catalog.catalog_service_base.CatalogServiceBase

class gooddata_sdk.catalog.catalog_service_base.**CatalogServiceBase**(*api_client:* GoodDataApiClient)

Bases: `object`

__init__(*api_client:* GoodDataApiClient) → None

Methods

__init__(api_client)
get_organization()
layout_organization_folder(layout_root_path)

Attributes

organization_id

gooddata_sdk.catalog.data_source

Modules

gooddata_sdk.catalog.data_source.action_requests
gooddata_sdk.catalog.data_source.declarative_model
gooddata_sdk.catalog.data_source.entity_model
gooddata_sdk.catalog.data_source.service
gooddata_sdk.catalog.data_source.validation

gooddata_sdk.catalog.data_source.action_requests

Modules

gooddata_sdk.catalog.data_source.action_requests.ldm_request
gooddata_sdk.catalog.data_source.action_requests.scan_model_request

gooddata_sdk.catalog.data_source.action_requests.ldm_request

Classes

CatalogGenerateLdmRequest(*[, separator, ...])

gooddata_sdk.catalog.data_source.action_requests.ldm_request.CatalogGenerateLdmRequest

class gooddata_sdk.catalog.data_source.action_requests.ldm_request.**CatalogGenerateLdmRequest**(*, *separator: str = '__', generate_long_ids: Optional[bool] = None, table_prefix: Optional[str] = None, view_prefix: Optional[str] = None, primary_label_p Optional[str] = None, secondary_label Optional[str] = None, fact_prefix: Optional[str] = None, date_granula Optional[str] = None, grain_prefix: Optional[str] = None, reference_prefix: Optional[str] = None,*

Bases: *Base*

__init__(*, *separator: str = '__'*, *generate_long_ids: Optional[bool] = None*, *table_prefix: Optional[str] = None*, *view_prefix: Optional[str] = None*, *primary_label_prefix: Optional[str] = None*, *secondary_label_prefix: Optional[str] = None*, *fact_prefix: Optional[str] = None*, *date_granularities: Optional[str] = None*, *grain_prefix: Optional[str] = None*, *reference_prefix: Optional[str] = None*, *grain_reference_prefix: Optional[str] = None*, *denorm_prefix: Optional[str] = None*, *wdf_prefix: Optional[str] = None*) → None

Method generated by attrs for class CatalogGenerateLdmRequest.

Methods

__init__(*[, separator, generate_long_ids, ...])	Method generated by attrs for class CatalogGenerateLdmRequest.
client_class()	
from_api(entity)	Creates object from entity passed by client class, which represents it as dictionary.
from_dict(data[, camel_case])	Creates object from dictionary.
to_api()	
to_dict([camel_case])	Converts object into dictionary.

Attributes

separator
generate_long_ids
table_prefix
view_prefix
primary_label_prefix
secondary_label_prefix
fact_prefix
date_granularities
grain_prefix
reference_prefix
grain_reference_prefix
denorm_prefix
wdf_prefix

classmethod from_api(*entity: Dict[str, Any]*) → T

Creates object from entity passed by client class, which represents it as dictionary.

classmethod from_dict(*data: Dict[str, Any]*, *camel_case: bool = True*) → T

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake_case.

to_dict(*camel_case: bool = True*) → Dict[str, Any]

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

gooddata_sdk.catalog.data_source.action_requests.scan_model_request

Functions

one_scan_true(instance, *args)

gooddata_sdk.catalog.data_source.action_requests.scan_model_request.one_scan_true

__init__(*, *separator: str = '__'*, *scan_tables: bool = True*, *scan_views: bool = False*, *table_prefix: Optional[str] = None*, *view_prefix: Optional[str] = None*) → None

Method generated by attrs for class CatalogScanModelRequest.

Methods

__init__(*[, separator, scan_tables, ...])	Method generated by attrs for class CatalogScanModelRequest.
client_class()	
from_api(entity)	Creates object from entity passed by client class, which represents it as dictionary.
from_dict(data[, camel_case])	Creates object from dictionary.
to_api()	
to_dict([camel_case])	Converts object into dictionary.

Attributes

separator
scan_tables
scan_views
table_prefix
view_prefix

classmethod from_api(*entity: Dict[str, Any]*) → T

Creates object from entity passed by client class, which represents it as dictionary.

classmethod from_dict(*data: Dict[str, Any]*, *camel_case: bool = True*) → T

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake_case.

to_dict(*camel_case: bool = True*) → Dict[str, Any]

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

gooddata_sdk.catalog.identifier

Classes

CatalogAssigneeIdentifier(*, id, type)
CatalogGrainIdentifier(*, id, type)
CatalogLabelIdentifier(*, id, type)
CatalogReferenceIdentifier(*, id)
CatalogUserGroupIdentifier(*, id, type)
CatalogWorkspaceIdentifier(*, id)

gooddata_sdk.catalog.identifier.CatalogAssigneeIdentifier

class gooddata_sdk.catalog.identifier.**CatalogAssigneeIdentifier**(*, *id: str*, *type: str*)

Bases: *Base*

__init__(*, *id: str*, *type: str*) → None

Method generated by attrs for class CatalogAssigneeIdentifier.

Methods

__init__(*, id, type)	Method generated by attrs for class CatalogAssigneeIdentifier.
client_class()	
from_api(entity)	Creates object from entity passed by client class, which represents it as dictionary.
from_dict(data[, camel_case])	Creates object from dictionary.
to_api()	
to_dict([camel_case])	Converts object into dictionary.

Attributes

id
type

classmethod from_api(*entity: Dict[str, Any]*) → T

Creates object from entity passed by client class, which represents it as dictionary.

classmethod from_dict(*data: Dict[str, Any]*, *camel_case: bool = True*) → T

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake_case.

to_dict(*camel_case: bool = True*) → Dict[str, Any]

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

gooddata_sdk.catalog.identifier.CatalogGrainIdentifier

class gooddata_sdk.catalog.identifier.**CatalogGrainIdentifier**(*, *id: str*, *type: str*)

Bases: *Base*

__init__(*, *id: str*, *type: str*) → None

Method generated by attrs for class CatalogGrainIdentifier.

Methods

__init__(*, id, type)	Method generated by attrs for class CatalogGrainIdentifier.
client_class()	
from_api(entity)	Creates object from entity passed by client class, which represents it as dictionary.
from_dict(data[, camel_case])	Creates object from dictionary.
to_api()	
to_dict([camel_case])	Converts object into dictionary.

Attributes

id
type

classmethod from_api(*entity: Dict[str, Any]*) → T

Creates object from entity passed by client class, which represents it as dictionary.

classmethod from_dict(*data: Dict[str, Any]*, *camel_case: bool = True*) → T

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake_case.

to_dict(*camel_case: bool = True*) → Dict[str, Any]

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

gooddata_sdk.catalog.identifier.CatalogLabelIdentifier

class gooddata_sdk.catalog.identifier.**CatalogLabelIdentifier**(*, *id: str*, *type: str*)

Bases: *Base*

__init__(*, *id: str*, *type: str*) → None

Method generated by attrs for class CatalogLabelIdentifier.

Methods

__init__(*, id, type)	Method generated by attrs for class CatalogLabelIdentifier.
client_class()	
from_api(entity)	Creates object from entity passed by client class, which represents it as dictionary.
from_dict(data[, camel_case])	Creates object from dictionary.
to_api()	
to_dict([camel_case])	Converts object into dictionary.

Attributes

id
type

classmethod from_api(*entity: Dict[str, Any]*) → T

Creates object from entity passed by client class, which represents it as dictionary.

classmethod from_dict(*data: Dict[str, Any]*, *camel_case: bool = True*) → T

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake_case.

to_dict(*camel_case: bool = True*) → Dict[str, Any]

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

gooddata_sdk.catalog.identifier.CatalogReferenceIdentifier

class gooddata_sdk.catalog.identifier.**CatalogReferenceIdentifier**(*, *id: str*)

Bases: *Base*

__init__(*, *id: str*) → None

Method generated by attrs for class CatalogReferenceIdentifier.

Methods

__init__(*, id)	Method generated by attrs for class CatalogReferenceIdentifier.
client_class()	
from_api(entity)	Creates object from entity passed by client class, which represents it as dictionary.
from_dict(data[, camel_case])	Creates object from dictionary.
to_api()	
to_dict([camel_case])	Converts object into dictionary.

Attributes

id

classmethod from_api(*entity: Dict[str, Any]*) → T

Creates object from entity passed by client class, which represents it as dictionary.

classmethod from_dict(*data: Dict[str, Any]*, *camel_case: bool = True*) → T

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake_case.

to_dict(*camel_case: bool = True*) → Dict[str, Any]

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

gooddata_sdk.catalog.identifier.CatalogUserGroupIdentifier

class gooddata_sdk.catalog.identifier.**CatalogUserGroupIdentifier**(*, *id: str*, *type: str*)

Bases: *Base*

__init__(*, *id: str*, *type: str*) → None

Method generated by attrs for class CatalogUserGroupIdentifier.

Methods

__init__(*, id, type)	Method generated by attrs for class CatalogUserGroupIdentifier.
client_class()	
from_api(entity)	Creates object from entity passed by client class, which represents it as dictionary.
from_dict(data[, camel_case])	Creates object from dictionary.
to_api()	
to_dict([camel_case])	Converts object into dictionary.

Attributes

id
type

classmethod from_api(*entity: Dict[str, Any]*) → T

Creates object from entity passed by client class, which represents it as dictionary.

classmethod from_dict(*data: Dict[str, Any]*, *camel_case: bool = True*) → T

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake_case.

to_dict(*camel_case: bool = True*) → Dict[str, Any]

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

gooddata_sdk.catalog.identifier.CatalogWorkspaceIdentifier

class gooddata_sdk.catalog.identifier.**CatalogWorkspaceIdentifier**(*, *id: str*)

Bases: *Base*

__init__(*, *id: str*) → None

Method generated by attrs for class CatalogWorkspaceIdentifier.

Methods

__init__(*, id)	Method generated by attrs for class CatalogWorkspaceIdentifier.
client_class()	
from_api(entity)	Creates object from entity passed by client class, which represents it as dictionary.
from_dict(data[, camel_case])	Creates object from dictionary.
to_api()	
to_dict([camel_case])	Converts object into dictionary.

Attributes

id

classmethod from_api(*entity: Dict[str, Any]*) → T

Creates object from entity passed by client class, which represents it as dictionary.

classmethod from_dict(*data: Dict[str, Any]*, *camel_case: bool = True*) → T

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake_case.

to_dict(*camel_case: bool = True*) → Dict[str, Any]

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

gooddata_sdk.catalog.organization.entity_model.organization.CatalogOrganization

class gooddata_sdk.catalog.organization.entity_model.organization.**CatalogOrganization**(*, *id: str*, *attributes: CatalogOrganizationAttributes*)

Bases: *Base*

__init__(*, *id: str*, *attributes:* CatalogOrganizationAttributes) → None

Method generated by attrs for class CatalogOrganization.

Methods

__init__(*, id, attributes)	Method generated by attrs for class CatalogOrganization.
client_class()	
from_api(entity)	Creates object from entity passed by client class, which represents it as dictionary.
from_dict(data[, camel_case])	Creates object from dictionary.
to_api()	
to_dict([camel_case])	Converts object into dictionary.

Attributes

id
attributes

classmethod from_api(*entity: Dict[str, Any]*) → T

Creates object from entity passed by client class, which represents it as dictionary.

classmethod from_dict(*data: Dict[str, Any]*, *camel_case: bool = True*) → T

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake_case.

to_dict(*camel_case: bool = True*) → Dict[str, Any]

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

gooddata_sdk.catalog.organization.entity_model.organization.CatalogOrganizationAttributes

class gooddata_sdk.catalog.organization.entity_model.organization.**CatalogOrganizationAttributes**(*, *name: Optional[str] = None*, *hostname: Optional[str] = None*, *allowed_origins: Optional[List[str]] = None*, *oauth_issuer_location: Optional[str] = None*, *oauth_client_id: Optional[str] = None*)

Bases: *Base*

__init__(*, *name: Optional[str] = None*, *hostname: Optional[str] = None*, *allowed_origins: Optional[List[str]] = None*, *oauth_issuer_location: Optional[str] = None*, *oauth_client_id: Optional[str] = None*) → None

Method generated by attrs for class CatalogOrganizationAttributes.

Methods

__init__(*[, name, hostname, ...])	Method generated by attrs for class CatalogOrganizationAttributes.
client_class()	
from_api(entity)	Creates object from entity passed by client class, which represents it as dictionary.
from_dict(data[, camel_case])	Creates object from dictionary.
to_api()	
to_dict([camel_case])	Converts object into dictionary.

Attributes

name
hostname
allowed_origins
oauth_issuer_location
oauth_client_id

classmethod from_api(*entity: Dict[str, Any]*) → T

Creates object from entity passed by client class, which represents it as dictionary.

classmethod from_dict(*data: Dict[str, Any]*, *camel_case: bool = True*) → T

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake_case.

to_dict(*camel_case: bool = True*) → Dict[str, Any]

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

gooddata_sdk.catalog.organization.entity_model.organization.CatalogOrganizationDocument

class gooddata_sdk.catalog.organization.entity_model.organization.**CatalogOrganizationDocument**(*, *data:* CatalogOrganization)

Bases: *Base*

__init__(*, *data:* CatalogOrganization) → None

Method generated by attrs for class CatalogOrganizationDocument.

Methods

__init__(*, data)	Method generated by attrs for class CatalogOrganizationDocument.
client_class()	
from_api(entity)	Creates object from entity passed by client class, which represents it as dictionary.
from_dict(data[, camel_case])	Creates object from dictionary.
to_api([oauth_client_secret])	
to_dict([camel_case])	Converts object into dictionary.

Attributes

data

classmethod from_api(*entity: Dict[str, Any]*) → T

Creates object from entity passed by client class, which represents it as dictionary.

classmethod from_dict(*data: Dict[str, Any]*, *camel_case: bool = True*) → T

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake_case.

to_dict(*camel_case: bool = True*) → Dict[str, Any]

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

gooddata_sdk.catalog.organization.service

Classes

CatalogOrganizationService(api_client)

gooddata_sdk.catalog.organization.service.CatalogOrganizationService

class gooddata_sdk.catalog.organization.service.**CatalogOrganizationService**(*api_client:* GoodDataApiClient)

Bases: *CatalogServiceBase*

class gooddata_sdk.catalog.permission.declarative_model.permission.**CatalogDeclarativeDataSourcePermissi**

Bases: *Base*

__init__(*, *name: str*, *assignee:* CatalogAssigneeIdentifier) → None

Method generated by attrs for class CatalogDeclarativeDataSourcePermission.

Methods

__init__(*, name, assignee)	Method generated by attrs for class CatalogDeclarativeDataSourcePermission.
client_class()	
from_api(entity)	Creates object from entity passed by client class, which represents it as dictionary.
from_dict(data[, camel_case])	Creates object from dictionary.
to_api()	
to_dict([camel_case])	Converts object into dictionary.

Attributes

name
assignee

classmethod from_api(*entity: Dict[str, Any]*) → T

Creates object from entity passed by client class, which represents it as dictionary.

classmethod from_dict(*data: Dict[str, Any]*, *camel_case: bool = True*) → T

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake_case.

to_dict(*camel_case: bool = True*) → Dict[str, Any]

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

gooddata_sdk.catalog.permission.declarative_model.permission.CatalogDeclarativeSingleWorkspacePermission

class gooddata_sdk.catalog.permission.declarative_model.permission.**CatalogDeclarativeSingleWorkspacePer**

Bases: *Base*

__init__(*, *name: str*, *assignee:* CatalogAssigneeIdentifier) → None

Method generated by attrs for class CatalogDeclarativeSingleWorkspacePermission.

Methods

__init__(*, name, assignee)	Method generated by attrs for class CatalogDeclarativeSingleWorkspacePermission.
client_class()	
from_api(entity)	Creates object from entity passed by client class, which represents it as dictionary.
from_dict(data[, camel_case])	Creates object from dictionary.
to_api()	
to_dict([camel_case])	Converts object into dictionary.

Attributes

name
assignee

classmethod from_api(*entity: Dict[str, Any]*) → T

Creates object from entity passed by client class, which represents it as dictionary.

classmethod from_dict(*data: Dict[str, Any]*, *camel_case: bool = True*) → T

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake_case.

to_dict(*camel_case: bool = True*) → Dict[str, Any]

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

gooddata_sdk.catalog.permission.declarative_model.permission.CatalogDeclarativeWorkspaceHierarchyPermissi

class gooddata_sdk.catalog.permission.declarative_model.permission.**CatalogDeclarativeWorkspaceHierarchyP**

Bases: *Base*

__init__(*, *name: str*, *assignee:* CatalogAssigneeIdentifier) → None

Method generated by attrs for class CatalogDeclarativeWorkspaceHierarchyPermission.

Methods

__init__(*, name, assignee)	Method generated by attrs for class CatalogDeclarativeWorkspaceHierarchyPermission.
client_class()	
from_api(entity)	Creates object from entity passed by client class, which represents it as dictionary.
from_dict(data[, camel_case])	Creates object from dictionary.
to_api()	
to_dict([camel_case])	Converts object into dictionary.

Attributes

name
assignee

classmethod from_api(*entity: Dict[str, Any]*) → T

Creates object from entity passed by client class, which represents it as dictionary.

classmethod from_dict(*data: Dict[str, Any]*, *camel_case: bool = True*) → T

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake_case.

to_dict(*camel_case: bool = True*) → Dict[str, Any]

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

gooddata_sdk.catalog.permission.declarative_model.permission.CatalogDeclarativeWorkspacePermissions

class gooddata_sdk.catalog.permission.declarative_model.permission.**CatalogDeclarativeWorkspacePermissio**

Bases: *Base*

__init__(*, *permissions: List[CatalogDeclarativeSingleWorkspacePermission] = NOTHING*, *hierarchy_permissions: List[CatalogDeclarativeWorkspaceHierarchyPermission] = NOTHING*) → None

Method generated by attrs for class CatalogDeclarativeWorkspacePermissions.

Methods

__init__(*[, permissions, hierarchy_permissions])	Method generated by attrs for class CatalogDeclarativeWorkspacePermissions.
client_class()	
from_api(entity)	Creates object from entity passed by client class, which represents it as dictionary.
from_dict(data[, camel_case])	Creates object from dictionary.
to_api()	
to_dict([camel_case])	Converts object into dictionary.

Attributes

permissions
hierarchy_permissions

classmethod from_api(*entity: Dict[str, Any]*) → T

Creates object from entity passed by client class, which represents it as dictionary.

classmethod from_dict(*data: Dict[str, Any]*, *camel_case: bool = True*) → T

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake_case.

to_dict(*camel_case: bool = True*) → Dict[str, Any]

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

gooddata_sdk.catalog.permission.service

Classes

CatalogPermissionService(api_client)

gooddata_sdk.catalog.permission.service.CatalogPermissionService

class gooddata_sdk.catalog.permission.service.**CatalogPermissionService**(*api_client:* GoodDataApiClient)

Bases: *CatalogServiceBase*

Attributes

organization_id

gooddata_sdk.catalog.setting

Classes

CatalogDeclarativeSetting(*, id[, content])	

gooddata_sdk.catalog.setting.CatalogDeclarativeSetting

class gooddata_sdk.catalog.setting.**CatalogDeclarativeSetting**(*, *id: str*, *content: Optional[Dict[str, Any]] = None*)

Bases: *Base*

__init__(*, *id: str*, *content: Optional[Dict[str, Any]] = None*) → None

Method generated by attrs for class CatalogDeclarativeSetting.

Methods

__init__(*, id[, content])	Method generated by attrs for class CatalogDeclarativeSetting.
client_class()	
from_api(entity)	Creates object from entity passed by client class, which represents it as dictionary.
from_dict(data[, camel_case])	Creates object from dictionary.
to_api()	
to_dict([camel_case])	Converts object into dictionary.

Attributes

id
content

classmethod from_api(*entity: Dict[str, Any]*) → T

Creates object from entity passed by client class, which represents it as dictionary.

classmethod from_dict(*data: Dict[str, Any]*, *camel_case: bool = True*) → T

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake_case.

to_dict(*camel_case: bool = True*) → Dict[str, Any]

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

Bases: *Base*

__init__(*, *id: str*, *auth_id: Optional[str] = None*, *user_groups: List[CatalogUserGroupIdentifier] = NOTHING*, *settings: List[CatalogDeclarativeSetting] = NOTHING*) → None

Method generated by attrs for class CatalogDeclarativeUser.

Methods

__init__(*, id[, auth_id, user_groups, settings])	Method generated by attrs for class CatalogDeclarativeUser.
client_class()	
from_api(entity)	Creates object from entity passed by client class, which represents it as dictionary.
from_dict(data[, camel_case])	Creates object from dictionary.
to_api()	
to_dict([camel_case])	Converts object into dictionary.

Attributes

id
auth_id
user_groups
settings

classmethod from_api(*entity: Dict[str, Any]*) → T

Creates object from entity passed by client class, which represents it as dictionary.

classmethod from_dict(*data: Dict[str, Any]*, *camel_case: bool = True*) → T

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake_case.

to_dict(*camel_case: bool = True*) → Dict[str, Any]

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

gooddata_sdk.catalog.user.declarative_model.user.CatalogDeclarativeUsers

class gooddata_sdk.catalog.user.declarative_model.user.**CatalogDeclarativeUsers**(*, *users: List[CatalogDeclarativeUser]*)

Bases: *Base*

__init__(*, *users: List[CatalogDeclarativeUser]*) → None

Method generated by attrs for class CatalogDeclarativeUsers.

Methods

__init__(*, users)	Method generated by attrs for class CatalogDeclarativeUsers.
client_class()	
from_api(entity)	Creates object from entity passed by client class, which represents it as dictionary.
from_dict(data[, camel_case])	Creates object from dictionary.
load_from_disk(layout_organization_folder)	
store_to_disk(layout_organization_folder)	
to_api()	
to_dict([camel_case])	Converts object into dictionary.

Attributes

users

classmethod from_api(*entity: Dict[str, Any]*) → T

Creates object from entity passed by client class, which represents it as dictionary.

classmethod from_dict(*data: Dict[str, Any]*, *camel_case: bool = True*) → T

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake_case.

to_dict(*camel_case: bool = True*) → Dict[str, Any]

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

gooddata_sdk.catalog.user.declarative_model.user_and_user_groups

Classes

CatalogDeclarativeUsersUserGroups(*, users, ...)

gooddata_sdk.catalog.user.declarative_model.user_and_user_groups.CatalogDeclarativeUsersUserGroups

class gooddata_sdk.catalog.user.declarative_model.user_group.**CatalogDeclarativeUserGroup**(*, *id: str*, *parents: Optional[List[*Catalog = *None*)

Bases: *Base*

__init__(*, *id: str*, *parents: Optional[List[*CatalogUserGroupIdentifier*]] = None*) → None

Method generated by attrs for class CatalogDeclarativeUserGroup.

Methods

__init__(*, id[, parents])	Method generated by attrs for class CatalogDeclarativeUserGroup.
client_class()	
from_api(entity)	Creates object from entity passed by client class, which represents it as dictionary.
from_dict(data[, camel_case])	Creates object from dictionary.
to_api()	
to_dict([camel_case])	Converts object into dictionary.

Attributes

id
parents

classmethod from_api(*entity: Dict[str, Any]*) → T

Creates object from entity passed by client class, which represents it as dictionary.

classmethod from_dict(*data: Dict[str, Any]*, *camel_case: bool = True*) → T

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake_case.

to_dict(*camel_case: bool = True*) → Dict[str, Any]

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

gooddata_sdk.catalog.user.declarative_model.user_group.CatalogDeclarativeUserGroups

class gooddata_sdk.catalog.user.declarative_model.user_group.**CatalogDeclarativeUserGroups**(*, *user_groups: List[CatalogDecl = NOTHING*)

Bases: *Base*

__init__(*, *user_groups: List[CatalogDeclarativeUserGroup] = NOTHING*) → None

Method generated by attrs for class CatalogDeclarativeUserGroups.

Methods

__init__(*[, user_groups])	Method generated by attrs for class CatalogDeclarativeUserGroups.
client_class()	
from_api(entity)	Creates object from entity passed by client class, which represents it as dictionary.
from_dict(data[, camel_case])	Creates object from dictionary.
load_from_disk(layout_organization_folder)	
store_to_disk(layout_organization_folder)	
to_api()	
to_dict([camel_case])	Converts object into dictionary.

Attributes

user_groups

classmethod from_api(*entity: Dict[str, Any]*) → T

Creates object from entity passed by client class, which represents it as dictionary.

classmethod from_dict(*data: Dict[str, Any]*, *camel_case: bool = True*) → T

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake_case.

to_dict(*camel_case: bool = True*) → Dict[str, Any]

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

gooddata_sdk.catalog.user.entity_model

Modules

gooddata_sdk.catalog.user.entity_model.user

gooddata_sdk.catalog.user.entity_model.user.CatalogUser

class gooddata_sdk.catalog.user.entity_model.user.**CatalogUser**(*, *id: str*, *attributes: Optional[CatalogUserAttributes] = None*, *relationships: Optional[CatalogUserRelationships] = None*)

Bases: *Base*

__init__(*, *id: str*, *attributes: Optional[CatalogUserAttributes] = None*, *relationships: Optional[CatalogUserRelationships] = None*) → None

Method generated by attrs for class CatalogUser.

Methods

__init__(*, id[, attributes, relationships])	Method generated by attrs for class CatalogUser.
client_class()	
from_api(entity)	Creates object from entity passed by client class, which represents it as dictionary.
from_dict(data[, camel_case])	Creates object from dictionary.
init(user_id[, authentication_id, ...])	
to_api()	
to_dict([camel_case])	Converts object into dictionary.

Attributes

get_user_groups
id
attributes
relationships

classmethod from_api(*entity: Dict[str, Any]*) → T

Creates object from entity passed by client class, which represents it as dictionary.

classmethod from_dict(*data: Dict[str, Any]*, *camel_case: bool = True*) → T

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake_case.

to_dict(*camel_case: bool = True*) → Dict[str, Any]

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

gooddata_sdk.catalog.user.entity_model.user.CatalogUserAttributes

class gooddata_sdk.catalog.user.entity_model.user.**CatalogUserAttributes**(*, *authentication_id: Optional[str] = None*)

Bases: Base

__init__(*, *authentication_id: Optional[str] = None*) → None

Method generated by attrs for class CatalogUserAttributes.

Methods

__init__(*[, authentication_id])	Method generated by attrs for class CatalogUserAttributes.
client_class()	
from_api(entity)	Creates object from entity passed by client class, which represents it as dictionary.
from_dict(data[, camel_case])	Creates object from dictionary.
to_api()	
to_dict([camel_case])	Converts object into dictionary.

Attributes

authentication_id

classmethod from_api(*entity: Dict[str, Any]*) → T

Creates object from entity passed by client class, which represents it as dictionary.

classmethod from_dict(*data: Dict[str, Any]*, *camel_case: bool = True*) → T

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake_case.

to_dict(*camel_case: bool = True*) → Dict[str, Any]

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

gooddata_sdk.catalog.user.entity_model.user.CatalogUserDocument

class gooddata_sdk.catalog.user.entity_model.user.**CatalogUserDocument**(*, *data:* CatalogUser)

Bases: *Base*

__init__(*, *data:* CatalogUser) → None

Method generated by attrs for class CatalogUserDocument.

Methods

__init__(*, data)	Method generated by attrs for class CatalogUserDocument.
client_class()	
from_api(entity)	Creates object from entity passed by client class, which represents it as dictionary.
from_dict(data[, camel_case])	Creates object from dictionary.
init(user_id[, authentication_id, ...])	
to_api()	
to_dict([camel_case])	Converts object into dictionary.
update_user([authentication_id, user_group_ids])	

Attributes

data

classmethod from_api(*entity: Dict[str, Any]*) → T

Creates object from entity passed by client class, which represents it as dictionary.

classmethod from_dict(*data: Dict[str, Any]*, *camel_case: bool = True*) → T

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake_case.

to_dict(*camel_case: bool = True*) → Dict[str, Any]

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

gooddata_sdk.catalog.user.entity_model.user.CatalogUserGroupsData

class gooddata_sdk.catalog.user.entity_model.user.**CatalogUserGroupsData**(*, *data: Optional[List[CatalogUserGroup]] = None*)

Bases: *Base*

__init__(*, *data: Optional[List[CatalogUserGroup]] = None*) → None

Method generated by attrs for class CatalogUserGroupsData.

Methods

__init__(*[, data])	Method generated by attrs for class CatalogUserGroupsData.
client_class()	
from_api(entity)	Creates object from entity passed by client class, which represents it as dictionary.
from_dict(data[, camel_case])	Creates object from dictionary.
to_api()	
to_dict([camel_case])	Converts object into dictionary.

Attributes

get_user_groups
data

classmethod from_api(*entity: Dict[str, Any]*) → T

Creates object from entity passed by client class, which represents it as dictionary.

classmethod from_dict(*data: Dict[str, Any]*, *camel_case: bool = True*) → T

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake_case.

to_dict(*camel_case: bool = True*) → Dict[str, Any]

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

gooddata_sdk.catalog.user.entity_model.user.CatalogUserRelationships

class gooddata_sdk.catalog.user.entity_model.user.**CatalogUserRelationships**(*, *user_groups: Optional[CatalogUserGroupsData] = None*)

Bases: *Base*

__init__(*, *user_groups: Optional[CatalogUserGroupsData] = None*) → None

Method generated by attrs for class CatalogUserRelationships.

Methods

__init__(*[, user_groups])	Method generated by attrs for class CatalogUserRelationships.
client_class()	
create_user_relationships(user_group_ids)	
from_api(entity)	Creates object from entity passed by client class, which represents it as dictionary.
from_dict(data[, camel_case])	Creates object from dictionary.
to_api()	
to_dict([camel_case])	Converts object into dictionary.

Attributes

get_user_groups
user_groups

classmethod from_api(*entity: Dict[str, Any]*) → T

Creates object from entity passed by client class, which represents it as dictionary.

classmethod from_dict(*data: Dict[str, Any]*, *camel_case: bool = True*) → T

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake_case.

to_dict(*camel_case: bool = True*) → Dict[str, Any]

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

gooddata_sdk.catalog.user.entity_model.user_group

Classes

CatalogUserGroup(*, id[, relationships])
CatalogUserGroupDocument(*, data)
CatalogUserGroupParents(*[, data])
CatalogUserGroupRelationships(*[, parents])

gooddata_sdk.catalog.user.entity_model.user_group.CatalogUserGroup

class gooddata_sdk.catalog.user.entity_model.user_group.**CatalogUserGroup**(*, *id: str*, *relationships: Optional[CatalogUserGroupRelationships] = None*)

Bases: *Base*

__init__(*, *id: str*, *relationships: Optional[CatalogUserGroupRelationships] = None*) → None

Method generated by attrs for class CatalogUserGroup.

Methods

__init__(*, id[, relationships])	Method generated by attrs for class CatalogUserGroup.
client_class()	
from_api(entity)	Creates object from entity passed by client class, which represents it as dictionary.
from_dict(data[, camel_case])	Creates object from dictionary.
init(user_group_id[, user_group_parent_ids])	
to_api()	
to_dict([camel_case])	Converts object into dictionary.

Attributes

get_parents
id
relationships

classmethod from_api(*entity: Dict[str, Any]*) → T

Creates object from entity passed by client class, which represents it as dictionary.

classmethod from_dict(*data: Dict[str, Any]*, *camel_case: bool = True*) → T

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake_case.

to_dict(*camel_case: bool = True*) → Dict[str, Any]

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

gooddata_sdk.catalog.user.entity_model.user_group.CatalogUserGroupDocument

class gooddata_sdk.catalog.user.entity_model.user_group.**CatalogUserGroupDocument**(*, *data:* CatalogUserGroup)

Bases: *Base*

__init__(*, *data:* CatalogUserGroup) → None

Method generated by attrs for class CatalogUserGroupDocument.

Methods

__init__(*, data)	Method generated by attrs for class CatalogUserGroupDocument.
client_class()	
from_api(entity)	Creates object from entity passed by client class, which represents it as dictionary.
from_dict(data[, camel_case])	Creates object from dictionary.
init(user_group_id[, user_group_parent_ids])	
to_api()	
to_dict([camel_case])	Converts object into dictionary.
update_user_group([user_group_parents_id])	

Attributes

data

classmethod from_api(*entity: Dict[str, Any]*) → T

Creates object from entity passed by client class, which represents it as dictionary.

classmethod from_dict(*data: Dict[str, Any]*, *camel_case: bool = True*) → T

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake_case.

to_dict(*camel_case: bool = True*) → Dict[str, Any]

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

gooddata_sdk.catalog.user.entity_model.user_group.CatalogUserGroupParents

class gooddata_sdk.catalog.user.entity_model.user_group.**CatalogUserGroupParents**(*, *data: Optional[List[*CatalogUserGroup *= None*)

Bases: *Base*

__init__(*, *data: Optional[List[*CatalogUserGroup*]] = None*) → None

Method generated by attrs for class CatalogUserGroupParents.

Methods

__init__(*[, data])	Method generated by attrs for class CatalogUserGroupParents.
client_class()	
from_api(entity)	Creates object from entity passed by client class, which represents it as dictionary.
from_dict(data[, camel_case])	Creates object from dictionary.
to_api()	
to_dict([camel_case])	Converts object into dictionary.

Attributes

get_parents
data

classmethod from_api(*entity: Dict[str, Any]*) → T

Creates object from entity passed by client class, which represents it as dictionary.

classmethod from_dict(*data: Dict[str, Any]*, *camel_case: bool = True*) → T

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake_case.

to_dict(*camel_case: bool = True*) → Dict[str, Any]

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

gooddata_sdk.catalog.user.entity_model.user_group.CatalogUserGroupRelationships

class gooddata_sdk.catalog.user.entity_model.user_group.**CatalogUserGroupRelationships**(*, *parents: Optional[*CatalogUserGro *= None*)

Bases: *Base*

__init__(*, *parents: Optional[CatalogUserGroupParents] = None*) → None

Method generated by attrs for class CatalogUserGroupRelationships.

Methods

__init__(*[, parents])	Method generated by attrs for class CatalogUserGroupRelationships.
client_class()	
create_user_group_relationships(...)	
from_api(entity)	Creates object from entity passed by client class, which represents it as dictionary.
from_dict(data[, camel_case])	Creates object from dictionary.
to_api()	
to_dict([camel_case])	Converts object into dictionary.

Attributes

get_parents
parents

classmethod from_api(*entity: Dict[str, Any]*) → T

Creates object from entity passed by client class, which represents it as dictionary.

classmethod from_dict(*data: Dict[str, Any]*, *camel_case: bool = True*) → T

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake_case.

to_dict(*camel_case: bool = True*) → Dict[str, Any]

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

load_declarative_ldm(workspace_id[, ...])	
put_declarative_analytics_model(...)	
put_declarative_ldm(workspace_id, ldm[, ...])	
store_declarative_analytics_model(workspace_id)	
store_declarative_ldm(workspace_id[, ...])	

Attributes

organization_id

compute_valid_objects(*workspace_id: str*, *ctx: Union[*Attribute, Metric, Filter, CatalogLabel, CatalogFact, CatalogMetric, *List[Union[*Attribute, Metric, Filter, CatalogLabel, CatalogFact, CatalogMetric*]]*, ExecutionDefinition*]*) → Dict[str, Set[str]]

Returns attributes, facts, and metrics which are valid to add to a context that already contains some entities from the semantic model. The entities are typically used to compute analytics and come from the execution definition. You may, however, specify the entities through different layers of convenience.

Parameters

- **workspace_id** – workspace identifier
- **ctx** – items already in context. you can specify context in one of the following ways:
  - single item or list of items from the execution model
  - single item or list of items from catalog model; catalog fact, label or metric may be added
  - the entire execution definition that is used to compute analytics

Returns

a dict of sets; type of available object is used as key in the dict, the value is a set containing id's of available items

get_full_catalog(*workspace_id: str*) → *CatalogWorkspaceContent*

Retrieves catalog for a workspace. Catalog contains all data sets and metrics defined in that workspace.

Parameters

workspace_id – workspace identifier

gooddata_sdk.catalog.workspace.declarative_model

workspace_data_filter_settings
description
workspace

classmethod from_api(*entity: Dict[str, Any]*) → T

Creates object from entity passed by client class, which represents it as dictionary.

classmethod from_dict(*data: dict[str, Any]*, *camel_case: bool = True*) → *CatalogDeclarativeWorkspaceDataFilter*

Parameters

- **data** – Data loaded for example from the file.
- **camel_case** – True if the variable names in the input data are serialized names as specified in the OpenAPI document. False if the variables names in the input data are python variable names in PEP-8 snake case.

Returns

CatalogDeclarativeWorkspaceDataFilter object.

to_dict(*camel_case: bool = True*) → Dict[str, Any]

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

gooddata_sdk.catalog.workspace.declarative_model.workspace.workspace.CatalogDeclarativeWorkspaceDataFilt

class gooddata_sdk.catalog.workspace.declarative_model.workspace.workspace.**CatalogDeclarativeWorkspaceDa**

Bases: *Base*

__init__(*, *id: str*, *title: str*, *filter_values: List[str]*, *workspace:* CatalogWorkspaceIdentifier, *description: Optional[str] = None*) → None

Method generated by attrs for class CatalogDeclarativeWorkspaceDataFilterSetting.

Methods

__init__(*, id, title, filter_values, workspace)	Method generated by attrs for class CatalogDeclarativeWorkspaceDataFilterSetting.
client_class()	
from_api(entity)	Creates object from entity passed by client class, which represents it as dictionary.

facts
id
obj_id
title
type

filter_dataset(*valid_objects: Dict[str, Set[str]]*) → Optional[*CatalogDataset*]

Filters dataset so that it contains only attributes and facts that are part of the provided valid objects structure.

Parameters
valid_objects – mapping of object type to a set of valid object ids

Returns
CatalogDataset containing only valid attributes and facts; None if all of the attributes and facts were filtered out

gooddata_sdk.catalog.workspace.entity_model.content_objects.dataset.CatalogFact

class gooddata_sdk.catalog.workspace.entity_model.content_objects.dataset.**CatalogFact**(*entity: dict[str, Any]*)

Bases: *CatalogEntity*

__init__(*entity: dict[str, Any]*) → None

Methods

gooddata_sdk.catalog.workspace.entity_model.graph_objects

Modules

gooddata_sdk.catalog.workspace.entity_model.graph_objects.graph

gooddata_sdk.catalog.workspace.entity_model.graph_objects.graph

Classes

CatalogDependentEntitiesGraph(*[, nodes, edges])
CatalogDependentEntitiesNode(*, id, type[, ...])
CatalogDependentEntitiesRequest(*[, identifiers])
CatalogDependentEntitiesResponse(*, graph)
CatalogEntityIdentifier(*, id, type)

gooddata_sdk.catalog.workspace.entity_model.graph_objects.graph.CatalogDependentEntitiesGraph

class gooddata_sdk.catalog.workspace.entity_model.graph_objects.graph.**CatalogDependentEntitiesGraph**(*, *node*
List[
=
NOT
ING
edge
List[
=
NOT
ING

Bases: *Base*

__init__(*, *nodes: List[*CatalogDependentEntitiesNode*] = NOTHING*, *edges: List[List[*CatalogEntityIdentifier*]] = NOTHING*) → None

Method generated by attrs for class CatalogDependentEntitiesGraph.

Methods

__init__(*[, nodes, edges])	Method generated by attrs for class CatalogDependentEntitiesGraph.
client_class()	
from_api(entity)	Creates object from entity passed by client class, which represents it as dictionary.
from_dict(data[, camel_case])	Creates object from dictionary.
to_api()	
to_dict([camel_case])	Converts object into dictionary.

Attributes

nodes
edges

classmethod from_api(*entity: Dict[str, Any]*) → T

Creates object from entity passed by client class, which represents it as dictionary.

classmethod from_dict(*data: Dict[str, Any]*, *camel_case: bool = True*) → T

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake_case.

to_dict(*camel_case: bool = True*) → Dict[str, Any]

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

gooddata_sdk.catalog.workspace.entity_model.graph_objects.graph.CatalogDependentEntitiesNode

class gooddata_sdk.catalog.workspace.entity_model.graph_objects.graph.**CatalogDependentEntitiesNode**(*, *id: str*, *type: str*, *title: Optional[str] = None*)

Bases: *Base*

__init__(*, *id: str*, *type: str*, *title: Optional[str] = None*) → None

Method generated by attrs for class CatalogDependentEntitiesNode.

Methods

`__init__`(*, id, type[, title])	Method generated by attrs for class CatalogDependentEntitiesNode.
`client_class`()	
`from_api`(entity)	Creates object from entity passed by client class, which represents it as dictionary.
`from_dict`(data[, camel_case])	Creates object from dictionary.
`to_api`()	
`to_dict`([camel_case])	Converts object into dictionary.

Attributes

`id`
`type`
`title`

classmethod from_api(*entity: Dict[str, Any]*) → T

Creates object from entity passed by client class, which represents it as dictionary.

classmethod from_dict(*data: Dict[str, Any]*, *camel_case: bool = True*) → T

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake_case.

to_dict(*camel_case: bool = True*) → Dict[str, Any]

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

gooddata_sdk.catalog.workspace.entity_model.graph_objects.graph.CatalogDependentEntitiesRequest

class gooddata_sdk.catalog.workspace.entity_model.graph_objects.graph.**CatalogDependentEntitiesRequest**(*,
id
ti
fi
L
=
N
IN

Bases: `Base`

__init__(*, *identifiers: List[*CatalogEntityIdentifier*] = NOTHING*) → None

Method generated by attrs for class CatalogDependentEntitiesRequest.

Methods

__init__(*[, identifiers])	Method generated by attrs for class CatalogDependentEntitiesRequest.
client_class()	
from_api(entity)	Creates object from entity passed by client class, which represents it as dictionary.
from_dict(data[, camel_case])	Creates object from dictionary.
to_api()	
to_dict([camel_case])	Converts object into dictionary.

Attributes

identifiers

classmethod from_api(*entity: Dict[str, Any]*) → T

Creates object from entity passed by client class, which represents it as dictionary.

classmethod from_dict(*data: Dict[str, Any]*, *camel_case: bool = True*) → T

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake_case.

to_dict(*camel_case: bool = True*) → Dict[str, Any]

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

gooddata_sdk.catalog.workspace.entity_model.graph_objects.graph.CatalogDependentEntitiesResponse

class gooddata_sdk.catalog.workspace.entity_model.graph_objects.graph.**CatalogDependentEntitiesResponse**(

Bases: *Base*

__init__(*, *graph:* CatalogDependentEntitiesGraph) → None

Method generated by attrs for class CatalogDependentEntitiesResponse.

Methods

__init__(*, graph)	Method generated by attrs for class CatalogDependentEntitiesResponse.
client_class()	
from_api(entity)	Creates object from entity passed by client class, which represents it as dictionary.
from_dict(data[, camel_case])	Creates object from dictionary.
to_api()	
to_dict([camel_case])	Converts object into dictionary.

Attributes

graph

classmethod from_api(*entity: Dict[str, Any]*) → T

Creates object from entity passed by client class, which represents it as dictionary.

classmethod from_dict(*data: Dict[str, Any]*, *camel_case: bool = True*) → T

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake_case.

to_dict(*camel_case: bool = True*) → Dict[str, Any]

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

gooddata_sdk.catalog.workspace.entity_model.graph_objects.graph.CatalogEntityIdentifier

class gooddata_sdk.catalog.workspace.entity_model.graph_objects.graph.**CatalogEntityIdentifier**(*, *id: str*, *type: str*)

Bases: *Base*

__init__(*, *id: str*, *type: str*) → None

Method generated by attrs for class CatalogEntityIdentifier.

Methods

__init__(*, id, type)	Method generated by attrs for class CatalogEntityIdentifier.
client_class()	
from_api(entity)	Creates object from entity passed by client class, which represents it as dictionary.
from_dict(data[, camel_case])	Creates object from dictionary.
to_api()	
to_dict([camel_case])	Converts object into dictionary.

Attributes

id
type

classmethod from_api(*entity: Dict[str, Any]*) → T

Creates object from entity passed by client class, which represents it as dictionary.

classmethod from_dict(*data: Dict[str, Any]*, *camel_case: bool = True*) → T

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake_case.

to_dict(*camel_case: bool = True*) → Dict[str, Any]

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

gooddata_sdk.catalog.workspace.entity_model.workspace

Classes

CatalogWorkspace(workspace_id, name[, parent_id])

gooddata_sdk.catalog.workspace.entity_model.workspace.CatalogWorkspace

class gooddata_sdk.catalog.workspace.entity_model.workspace.**CatalogWorkspace**(*workspace_id: str*, *name: str*, *parent_id: Optional[str] = None*)

Bases: *CatalogNameEntity*

__init__(*workspace_id: str*, *name: str*, *parent_id: Optional[str] = None*)

Methods

__init__(workspace_id, name[, parent_id])	
from_api(entity)	
to_api()	

gooddata_sdk.catalog.workspace.model_container

Classes

CatalogWorkspaceContent(valid_obj_fun, ...)	

gooddata_sdk.catalog.workspace.model_container.CatalogWorkspaceContent

class gooddata_sdk.catalog.workspace.model_container.**CatalogWorkspaceContent**(*valid_obj_fun: functools.partial[dict[str, set[str]]]*, *datasets: list[*CatalogDataset*]*, *metrics: list[*CatalogMetric*]*)

Bases: object

__init__(*valid_obj_fun: functools.partial[dict[str, set[str]]]*, *datasets: list[*CatalogDataset*]*, *metrics: list[*CatalogMetric*]*) → None

Methods

__init__(valid_obj_fun, datasets, metrics)	
catalog_with_valid_objects(ctx)	Returns a new instance of catalog which contains only those datasets (attributes and facts) that are valid in the provided context.
create_workspace_content_catalog(...)	
find_label_attribute(id_obj)	Get attribute by label id.
get_dataset(dataset_id)	Gets dataset by id.
get_metric(metric_id)	Gets metric by id.

Attributes

datasets
metrics

catalog_with_valid_objects(*ctx: Union[*Attribute, Metric, Filter, CatalogLabel, CatalogFact, CatalogMetric, *List[Union[*Attribute, Metric, Filter, CatalogLabel, CatalogFact, CatalogMetric*]], *ExecutionDefinition*]*) → *CatalogWorkspaceContent*

Returns a new instance of catalog which contains only those datasets (attributes and facts) that are valid in the provided context. The context is composed of one more more entities of the semantic model and the filtered catalog will contain only those entities that can be safely added on top of that existing context.

Parameters

ctx – existing context. you can specify context in one of the following ways:

- single item or list of items from the execution model
- single item or list of items from catalog model; catalog fact, label or metric may be added
- the entire execution definition that is used to compute analytics

find_label_attribute(*id_obj: Union[str,* ObjId*, Dict[str, Dict[str, str]], Dict[str, str]]*) → Optional[*CatalogAttribute*]

Get attribute by label id.

get_dataset(*dataset_id: Union[str,* ObjId*]*) → Optional[*CatalogDataset*]

Gets dataset by id. The id can be either an instance of ObjId or string containing serialized `ObjId ('dataset/some.dataset.id')` or contain just the id part (`some.dataset.id`).

Parameters

dataset_id – fully qualified dataset entity id (type/id) or just the identifier of dataset entity

Returns

instance of CatalogDataset or None if no such dataset in catalog

Return type

CatalogDataset

get_metric(*metric_id: Union[str,* ObjId*]*) → Optional[*CatalogMetric*]

Gets metric by id. The id can be either an instance of ObjId or string containing serialized ObjId ('metric/some.metric.id') or contain just the id part ('some.metric.id').

Parameters

metric_id – fully qualified metric entity id (type/id) or just the identifier of metric entity

Returns

instance of CatalogMetric or None if no such metric in catalog

Return type

CatalogMetric

gooddata_sdk.catalog.workspace.service

Classes

CatalogWorkspaceService(api_client)	

gooddata_sdk.catalog.workspace.service.CatalogWorkspaceService

class gooddata_sdk.catalog.workspace.service.**CatalogWorkspaceService**(*api_client:* GoodDataApiClient)

Bases: *CatalogServiceBase*

__init__(*api_client:* GoodDataApiClient) → None

Methods

__init__(api_client)	
create_or_update(workspace)	
delete_workspace(workspace_id)	This method is implemented according to our implementation of delete workspace, which returns HTTP 204 no matter if the workspace_id exists.
get_declarative_workspace(workspace_id)	
get_declarative_workspace_data_filters()	
get_declarative_workspaces()	
get_organization()	
get_workspace(workspace_id)	Gets workspace content and returns it as CatalogWorkspace object.
layout_organization_folder(layout_root_path)	
list_workspaces()	
load_and_put_declarative_workspace(workspace_id)	
load_and_put_declarative_workspace_data_filters([...])	
load_and_put_declarative_workspaces([...])	
load_declarative_workspace(workspace_id[, ...])	
load_declarative_workspace_data_filters([...])	
load_declarative_workspaces([layout_root_path])	
put_declarative_workspace(workspace_id, ...)	
put_declarative_workspace_data_filters(...)	
put_declarative_workspaces(workspace)	
store_declarative_workspace(workspace_id[, ...])	
store_declarative_workspace_data_filters([...])	
store_declarative_workspaces([layout_root_path])	

Attributes

organization_id

delete_workspace(*workspace_id: str*) → None

This method is implemented according to our implementation of delete workspace, which returns HTTP 204 no matter if the workspace_id exists.

get_workspace(*workspace_id: str*) → *CatalogWorkspace*

Gets workspace content and returns it as CatalogWorkspace object.

Parameters
workspace_id – An input string parameter of workspace id.

Returns
CatalogWorkspace object containing structure of workspace.

3.2.2 gooddata_sdk.client

Module containing a class that provides access to metadata and afm services.

Classes

GoodDataApiClient(host, token[, ...])	Provide access to metadata and afm services.

gooddata_sdk.client.GoodDataApiClient

class gooddata_sdk.client.**GoodDataApiClient**(*host: str*, *token: str*, *custom_headers: Optional[dict[str, str]] = None*, *extra_user_agent: Optional[str] = None*)

Bases: object

Provide access to metadata and afm services.

__init__(*host: str*, *token: str*, *custom_headers: Optional[dict[str, str]] = None*, *extra_user_agent: Optional[str] = None*) → None

Take url, token for connecting to GoodData.CN.

HTTP requests made by this class may be enriched by *custom_headers* dict containing header names as keys and header values as dict values.

extra_user_agent is optional string to be added to default http User-Agent header. This takes precedence over custom_headers setting.

Methods

__init__(host, token[, custom_headers, ...])	Take url, token for connecting to GoodData.CN.

Attributes

afm_client
metadata_client
scan_client

3.2.3 gooddata_sdk.compute

Modules

gooddata_sdk.compute.model
gooddata_sdk.compute.service

gooddata_sdk.compute.model

Modules

gooddata_sdk.compute.model.attribute
gooddata_sdk.compute.model.base
gooddata_sdk.compute.model.execution
gooddata_sdk.compute.model.filter
gooddata_sdk.compute.model.metric

gooddata_sdk.compute.model.attribute

Classes

Attribute(local_id, label)	

gooddata_sdk.compute.model.attribute.Attribute

class gooddata_sdk.compute.model.attribute.**Attribute**(*local_id: str*, *label: Union[*ObjId*, str]*)

Bases: *ExecModelEntity*

__init__(*local_id: str*, *label: Union[*ObjId*, str]*) → None

Creates new attribute that can be used to slice or dice metric values during computation.

Parameters

- **local_id** – identifier of the attribute within the execution
- **label** – identifier of the label to use for slicing or dicing; specified either as ObjId or str containing the label id

Methods

__init__(local_id, label)	Creates new attribute that can be used to slice or dice metric values during computation.
as_api_model()	
has_same_label(other)	

Attributes

label
local_id

gooddata_sdk.compute.model.base

Classes

ExecModelEntity()	
Filter()	
ObjId(id, type)	

gooddata_sdk.compute.model.base.ExecModelEntity

class gooddata_sdk.compute.model.base.**ExecModelEntity**

Bases: object

__init__() → None

Methods

__init__()
as_api_model()

gooddata_sdk.compute.model.base.Filter

class gooddata_sdk.compute.model.base.**Filter**

Bases: *ExecModelEntity*

__init__() → None

Methods

__init__()
as_api_model()
is_noop()

Attributes

apply_on_result

gooddata_sdk.compute.model.base.ObjId

class gooddata_sdk.compute.model.base.**ObjId**(*id: str*, *type: str*)

Bases: object

__init__(*id: str*, *type: str*) → None

Methods

__init__(id, type)
as_afm_id()
as_afm_id_attribute()
as_afm_id_dataset()
as_afm_id_label()
as_identifier()

Attributes

id
type

gooddata_sdk.compute.model.execution

Functions

compute_model_to_api_model([attributes, ...])	Transforms categorized execution model entities (attributes, metrics, facts) into an API model that can be used for computations of data results or computations of object availability.

gooddata_sdk.compute.model.execution.compute_model_to_api_model

gooddata_sdk.compute.model.execution.**compute_model_to_api_model**(*attributes: Optional[list[Attribute]] = None*, *metrics: Optional[list[Metric]] = None*, *filters: Optional[list[Filter]] = None*) → models.AFM

Transforms categorized execution model entities (attributes, metrics, facts) into an API model that can be used for computations of data results or computations of object availability.

Parameters

- **attributes** – optionally specify list of attributes
- **metrics** – optionally specify list of metrics
- **filters** – optionally specify list of filters

Classes

BareExecutionResponse(actions_api, ...)	Holds ExecutionResponse from triggered report computation and allows reading report's results.
Execution(actions_api, workspace_id, ...)	An envelope class holding execution related classes:
ExecutionDefinition(attributes, metrics, ...)	
ExecutionResponse	alias of *Execution*
ExecutionResult(result)	
TotalDefinition(local_id, aggregation, ...)	
TotalDimension(idx[, items])	

gooddata_sdk.compute.model.execution.BareExecutionResponse

class gooddata_sdk.compute.model.execution.**BareExecutionResponse**(*actions_api: ActionsApi*, *workspace_id: str*, *response: AfmExecutionResponse*)

Bases: `object`

Holds ExecutionResponse from triggered report computation and allows reading report's results.

__init__(*actions_api: ActionsApi*, *workspace_id: str*, *response: AfmExecutionResponse*)

Methods

__init__(actions_api, workspace_id, response)	
read_result(limit[, offset])	Reads from the execution result.

Attributes

`dimensions`
`result_id`
`workspace_id`

read_result(*limit: Union[int, list[int]]*, *offset: Union[None, int, list[int]] = None*) → *ExecutionResult*

Reads from the execution result.

gooddata_sdk.compute.model.execution.Execution

class gooddata_sdk.compute.model.execution.**Execution**(*actions_api: ActionsApi*, *workspace_id: str*, *exec_def:* ExecutionDefinition, *response: AfmExecutionResponse*)

Bases: object

An envelope class holding execution related classes:

- exec_def ExecutionDefinition
- bare_exec_response BareExecutionResponse

__init__(*actions_api: ActionsApi*, *workspace_id: str*, *exec_def:* ExecutionDefinition, *response: AfmExecutionResponse*)

Methods

__init__(actions_api, workspace_id, ...)
read_result(limit[, offset])

Attributes

bare_exec_response
dimensions
exec_def
result_id
workspace_id

gooddata_sdk.compute.model.execution.ExecutionDefinition

class gooddata_sdk.compute.model.execution.**ExecutionDefinition**(*attributes: Optional[list[*Attribute*]], metrics: Optional[list[*Metric*]], filters: Optional[list[*Filter*]], dimensions: list[Optional[list[str]]], totals: Optional[list[*TotalDefinition*]] = None*)

Bases: object

__init__(*attributes: Optional[list[*Attribute*]], metrics: Optional[list[*Metric*]], filters: Optional[list[*Filter*]], dimensions: list[Optional[list[str]]], totals: Optional[list[*TotalDefinition*]] = None*) → None

Methods

__init__(attributes, metrics, filters, ...)
as_api_model()
has_attributes()
has_filters()
has_metrics()
is_one_dim()
is_two_dim()

Attributes

attributes
dimensions
filters
metrics

gooddata_sdk.compute.model.execution.ExecutionResponse

gooddata_sdk.compute.model.execution.**ExecutionResponse**

alias of *Execution*

gooddata_sdk.compute.model.execution.ExecutionResult

class gooddata_sdk.compute.model.execution.**ExecutionResult**(*result: ExecutionResult*)

Bases: object

__init__(*result: ExecutionResult*)

Methods

`__init__`(result)
`check_size_limits`(result_size_limits)
`get_all_header_values`(dim, header_idx)
`get_all_headers`(dim)
`is_complete`([dim])
`next_page_start`([dim])

Attributes

`data`
`grand_totals`
`headers`
`paging`
`paging_count`
`paging_offset`
`paging_total`

gooddata_sdk.compute.model.execution.TotalDefinition

class gooddata_sdk.compute.model.execution.**TotalDefinition**(*local_id: str*, *aggregation: str*, *metric_local_id: str*, *total_dims: list[*TotalDimension*]*)

Bases: `object`

__init__(*local_id: str*, *aggregation: str*, *metric_local_id: str*, *total_dims: list[*TotalDimension*]*) → None

Method generated by attrs for class TotalDefinition.

Methods

__init__(local_id, aggregation, ...)	Method generated by attrs for class TotalDefinition.

Attributes

local_id	total's local identifier
aggregation	aggregation function; case insensitive; one of SUM, MIN, MAX, MED, AVG
metric_local_id	local identifier of the measure to calculate total for
total_dims	

aggregation: str

aggregation function; case insensitive; one of SUM, MIN, MAX, MED, AVG

local_id: str

total's local identifier

metric_local_id: str

local identifier of the measure to calculate total for

gooddata_sdk.compute.model.execution.TotalDimension

class gooddata_sdk.compute.model.execution.**TotalDimension**(*idx: int*, *items: list[str] = NOTHING*)

Bases: object

__init__(*idx: int*, *items: list[str] = NOTHING*) → None

Method generated by attrs for class TotalDimension.

Methods

__init__(idx[, items])	Method generated by attrs for class TotalDimension.

Attributes

idx	index of dimension in which to calculate the total
items	items to use during total calculation

idx: int

index of dimension in which to calculate the total

items: list[str]

items to use during total calculation

Exceptions

ResultSizeLimitsExceeded(result_size_limits, ...)	

gooddata_sdk.compute.model.execution.ResultSizeLimitsExceeded

exception gooddata_sdk.compute.model.execution.**ResultSizeLimitsExceeded**(*result_size_limits: Tuple[Optional[int], ...]*, *actual_result_size: Tuple[Optional[int], ...]*, *first_violating_index: int*)

gooddata_sdk.compute.model.filter

Classes

AbsoluteDateFilter(dataset, from_date, to_date)	
AllTimeFilter()	Filter that is semantically equivalent to absent filter.
AttributeFilter(label[, values])	
MetricValueFilter(metric, operator, values)	
NegativeAttributeFilter(label[, values])	
PositiveAttributeFilter(label[, values])	
RankingFilter(metrics, operator, value, ...)	
RelativeDateFilter(dataset, granularity, ...)	

gooddata_sdk.compute.model.filter.AbsoluteDateFilter

class gooddata_sdk.compute.model.filter.**AbsoluteDateFilter**(*dataset:* ObjId, *from_date: str*, *to_date: str*)

Bases: *Filter*

__init__(*dataset:* ObjId, *from_date: str*, *to_date: str*) → None

Methods

__init__(dataset, from_date, to_date)
as_api_model()
is_noop()

Attributes

apply_on_result
dataset
from_date
to_date

gooddata_sdk.compute.model.filter.AllTimeFilter

class gooddata_sdk.compute.model.filter.**AllTimeFilter**

Bases: *Filter*

Filter that is semantically equivalent to absent filter.

This filter exists because 'All time filter' retrieved from GoodData.CN is non-standard as it does not have *from* and *to* fields; this is also the reason why as_api_model method is not implemented - it would lead to invalid object.

The main feature of this filter is noop.

__init__() → None

Methods

__init__()
as_api_model()
is_noop()

Attributes

apply_on_result

gooddata_sdk.compute.model.filter.AttributeFilter

class gooddata_sdk.compute.model.filter.**AttributeFilter**(*label: Union[ObjId, str, Attribute]*, *values: list[str] = None*)

Bases: *Filter*

__init__(*label: Union[ObjId, str, Attribute]*, *values: list[str] = None*) → None

Methods

__init__(label[, values])
as_api_model()
is_noop()

Attributes

apply_on_result
label
values

gooddata_sdk.compute.model.filter.MetricValueFilter

class gooddata_sdk.compute.model.filter.**MetricValueFilter**(*metric: Union[ObjId, str, Metric]*, *operator: str*, *values: Union[float, int, tuple[float, float]]*, *treat_nulls_as: Union[float, None] = None*)

Bases: *Filter*

__init__(*metric: Union[ObjId, str, Metric]*, *operator: str*, *values: Union[float, int, tuple[float, float]]*, *treat_nulls_as: Union[float, None] = None*) → None

Methods

__init__(metric, operator, values[, ...])
as_api_model()
is_noop()

Attributes

apply_on_result
metric
operator
treat_nulls_as
values

gooddata_sdk.compute.model.filter.NegativeAttributeFilter

class gooddata_sdk.compute.model.filter.**NegativeAttributeFilter**(*label: Union[ObjId, str, Attribute]*, *values: list[str] = None*)

Bases: *AttributeFilter*

__init__(*label: Union[ObjId, str, Attribute]*, *values: list[str] = None*) → None

Methods

__init__(label[, values])
as_api_model()
is_noop()

Attributes

apply_on_result
label
values

gooddata_sdk.compute.model.filter.PositiveAttributeFilter

class gooddata_sdk.compute.model.filter.**PositiveAttributeFilter**(*label: Union[ObjId, str, Attribute]*, *values: list[str] = None*)

Bases: *AttributeFilter*

__init__(*label: Union[ObjId, str, Attribute]*, *values: list[str] = None*) → None

Methods

__init__(label[, values])
as_api_model()
is_noop()

Attributes

apply_on_result
label
values

gooddata_sdk.compute.model.filter.RankingFilter

class gooddata_sdk.compute.model.filter.**RankingFilter**(*metrics: list[Union[ObjId, Metric, str]]*, *operator: str*, *value: int*, *dimensionality: Optional[list[Union[str, ObjId, Attribute, Metric]]]*)

Bases: *Filter*

__init__(*metrics: list[Union[ObjId, Metric, str]]*, *operator: str*, *value: int*, *dimensionality: Optional[list[Union[str, ObjId, Attribute, Metric]]]*) → None

Methods

__init__(metrics, operator, value, ...)
as_api_model()
is_noop()

Attributes

apply_on_result
dimensionality
metrics
operator
value

gooddata_sdk.compute.model.filter.RelativeDateFilter

class gooddata_sdk.compute.model.filter.**RelativeDateFilter**(*dataset: ObjId*, *granularity: str*, *from_shift: int*, *to_shift: int*)

Bases: *Filter*

__init__(*dataset: ObjId*, *granularity: str*, *from_shift: int*, *to_shift: int*) → None

Methods

__init__(dataset, granularity, from_shift, ...)
as_api_model()
is_noop()

Attributes

apply_on_result
dataset
from_shift
granularity
to_shift

gooddata_sdk.compute.model.metric

Classes

ArithmeticMetric(local_id, operator, operands)
Metric(local_id)
PopDate(attribute, periods_ago)
PopDateDataset(dataset, periods_ago)
PopDateMetric(local_id, metric, date_attributes)
PopDatesetMetric(local_id, metric, date_datasets)
SimpleMetric(local_id, item[, aggregation, ...])

gooddata_sdk.compute.model.metric.ArithmeticMetric

class gooddata_sdk.compute.model.metric.**ArithmeticMetric**(*local_id: str*, *operator: str*, *operands: list[Union[str,* Metric*]]*)

Bases: *Metric*

__init__(*local_id: str*, *operator: str*, *operands: list[Union[str,* Metric*]]*) → None

Methods

__init__(local_id, operator, operands)
as_api_model()

Attributes

local_id
operand_local_ids
operator

gooddata_sdk.compute.model.metric.Metric

class gooddata_sdk.compute.model.metric.**Metric**(*local_id: str*)

Bases: *ExecModelEntity*

__init__(*local_id: str*) → None

Methods

__init__(local_id)
as_api_model()

Attributes

local_id

gooddata_sdk.compute.model.metric.PopDate

class gooddata_sdk.compute.model.metric.**PopDate**(*attribute: Union[ObjId, Attribute]*, *periods_ago: int*)

Bases: object

__init__(*attribute: Union[ObjId, Attribute]*, *periods_ago: int*) → None

Methods

__init__(attribute, periods_ago)
as_api_model()

Attributes

attribute
periods_ago

gooddata_sdk.compute.model.metric.PopDateDataset

class gooddata_sdk.compute.model.metric.**PopDateDataset**(*dataset: Union[ObjId, str]*, *periods_ago: int*)

Bases: object

__init__(*dataset: Union[ObjId, str]*, *periods_ago: int*) → None

Methods

__init__(dataset, periods_ago)
as_api_model()

Attributes

dataset
periods_ago

gooddata_sdk.compute.model.metric.PopDateMetric

class gooddata_sdk.compute.model.metric.**PopDateMetric**(*local_id: str*, *metric: Union[str, Metric]*, *date_attributes: list[PopDate]*)

Bases: *Metric*

__init__(*local_id: str*, *metric: Union[str, Metric]*, *date_attributes: list[PopDate]*) → None

Methods

__init__(local_id, metric, date_attributes)
as_api_model()

Attributes

date_attributes
local_id
metric_local_id

gooddata_sdk.compute.model.metric.PopDatesetMetric

class gooddata_sdk.compute.model.metric.**PopDatesetMetric**(*local_id: str*, *metric: Union[str,* Metric*]*, *date_datasets: list[*PopDateDataset*]*)

Bases: *Metric*

__init__(*local_id: str*, *metric: Union[str,* Metric*]*, *date_datasets: list[*PopDateDataset*]*) → None

Methods

__init__(local_id, metric, date_datasets)
as_api_model()

Attributes

date_datasets
local_id
metric_local_id

gooddata_sdk.compute.model.metric.SimpleMetric

class gooddata_sdk.compute.model.metric.**SimpleMetric**(*local_id: str*, *item:* ObjId, *aggregation: Optional[str] = None*, *compute_ratio: bool = False*, *filters: list[*Filter*] = None*)

Bases: *Metric*

__init__(*local_id: str*, *item:* ObjId, *aggregation: Optional[str] = None*, *compute_ratio: bool = False*, *filters: list[*Filter*] = None*) → None

Methods

__init__(local_id, item[, aggregation, ...])	
as_api_model()	

Attributes

aggregation	
compute_ratio	
filters	
item	
local_id	

gooddata_sdk.compute.service

Classes

ComputeService(api_client)	Compute service drives computation of analytics for a GoodData.CN workspaces.

gooddata_sdk.compute.service.ComputeService

class gooddata_sdk.compute.service.**ComputeService**(*api_client:* GoodDataApiClient)

Bases: object

Compute service drives computation of analytics for a GoodData.CN workspaces. The prescription of what to compute is encapsulated by the ExecutionDefinition which consists of attributes, metrics, filters and definition of dimensions that influence how to organize the data in the result.

__init__(*api_client:* GoodDataApiClient)

Methods

__init__(api_client)	
for_exec_def(workspace_id, exec_def)	Starts computation in GoodData.CN workspace, using the provided execution definition.
get_exec_metadata(workspace_id, result_id)	Gets execution result's metadata from GoodData.CN workspace for given execution result ID.

for_exec_def(*workspace_id: str*, *exec_def:* ExecutionDefinition) → *Execution*

Starts computation in GoodData.CN workspace, using the provided execution definition.

Parameters

- **workspace_id** – workspace identifier
- **exec_def** – execution definition - this prescribes what to calculate, how to place labels and metric values into dimensions

get_exec_metadata(*workspace_id: str*, *result_id: str*) → ResultCacheMetadata

Gets execution result's metadata from GoodData.CN workspace for given execution result ID.

Parameters

- **workspace_id** – workspace identifier
- **result_id** – execution result ID

Returns

execution result's metadata

3.2.4 gooddata_sdk.insight

Classes

Insight(from_vis_obj[, side_loads])	
InsightAttribute(attribute)	
InsightBucket(bucket)	
InsightFilter(f)	
InsightMetric(metric)	Represents metric placed on an insight.
InsightService(api_client)	Insight Service allows retrieval of insights from a GD.CN workspace.

gooddata_sdk.insight.Insight

class gooddata_sdk.insight.**Insight**(*from_vis_obj: dict[str, Any]*, *side_loads: Optional[SideLoads] = None*)

Bases: object

__init__(*from_vis_obj: dict[str, Any]*, *side_loads: Optional[SideLoads] = None*) → None

Methods

__init__(from_vis_obj[, side_loads])
get_metadata(id_obj)

Attributes

are_relations_valid
attributes
buckets
description
filters
id
metrics
properties
side_loads
sorts
title
vis_url

gooddata_sdk.insight.InsightAttribute

class gooddata_sdk.insight.**InsightAttribute**(*attribute: dict[str, Any]*)

Bases: object

__init__(*attribute: dict[str, Any]*) → None

Methods

__init__(attribute)
as_computable()

Attributes

alias
label
label_id
local_id

gooddata_sdk.insight.InsightBucket

class gooddata_sdk.insight.**InsightBucket**(*bucket: dict[str, Any]*)

Bases: object

__init__(*bucket: dict[str, Any]*) → None

Methods

__init__(bucket)

Attributes

attributes
items
local_id
metrics

gooddata_sdk.insight.InsightFilter

class gooddata_sdk.insight.**InsightFilter**(*f: dict[str, Any]*)

Bases: object

__init__(*f: dict[str, Any]*) → None

Methods

__init__(f)	
as_computable()	

gooddata_sdk.insight.InsightMetric

class gooddata_sdk.insight.**InsightMetric**(*metric: dict[str, Any]*)

Bases: object

Represents metric placed on an insight.

Note: this has different shape than object passed to execution.

__init__(*metric: dict[str, Any]*) → None

Methods

__init__(metric)	
as_computable()	

Attributes

alias	
format	
is_time_comparison	
item	
item_id	
local_id	
time_comparison_master	If this is a time comparison metric, return local_id of the master metric from which it is derived.
title	

property time_comparison_master: Optional[str]

If this is a time comparison metric, return local_id of the master metric from which it is derived.

Returns

local_id of master metric, None if not a time comparison metric

gooddata_sdk.insight.InsightService

class gooddata_sdk.insight.**InsightService**(*api_client:* GoodDataApiClient)

Bases: `object`

Insight Service allows retrieval of insights from a GD.CN workspace. The insights are returned as instances of Insight which allows convenient introspection and necessary functions to convert the insight into a form where it can be sent for computation.

Note: the insights are created using GD.CN Analytical Designer or using GoodData.UI SDK. They are stored as visualization objects with a free-form body. This body is specific for AD & SDK. The Insight wrapper exists to take care of these discrepancies.

__init__(*api_client:* GoodDataApiClient) → None

Methods

__init__(api_client)	
get_insight(workspace_id, insight_id)	Gets a single insight from a workspace.
get_insights(workspace_id)	Gets all insights for a workspace.

get_insight(*workspace_id: str*, *insight_id: str*) → *Insight*

Gets a single insight from a workspace.

Parameters

- **workspace_id** – identifier of workspace to load insight from
- **insight_id** – identifier of the insight

Returns

single insight; the insight will contain sideloaded metadata about the entities it references

Return type

Insight

get_insights(*workspace_id: str*) → list[*Insight*]

Gets all insights for a workspace. The insights will contain side loaded metadata for all execution entities that they reference.

Parameters

workspace_id – identifier of workspace to load insights from

Returns

all available insights, each insight will contain side loaded metadata about the entities it references

3.2.5 gooddata_sdk.sdk

Classes

GoodDataSdk(client)	Top-level class that wraps all the functionality together.

gooddata_sdk.sdk.GoodDataSdk

class gooddata_sdk.sdk.**GoodDataSdk**(*client:* GoodDataApiClient)

Bases: object

Top-level class that wraps all the functionality together.

__init__(*client:* GoodDataApiClient) → None

Take instance of GoodDataApiClient and return new GoodDataSdk instance.

Useful when customized GoodDataApiClient is needed. Usually users should use *GoodDataSdk.create* classmethod.

Methods

__init__(client)	Take instance of GoodDataApiClient and return new GoodDataSdk instance.
create(host_, token_[, extra_user_agent_])	Create common GoodDataApiClient and return new GoodDataSdk instance.

Attributes

catalog_data_source
catalog_organization
catalog_permission
catalog_user
catalog_workspace
catalog_workspace_content
client
compute
insights
support
tables

classmethod create(*host_: str*, *token_: str*, *extra_user_agent_: Optional[str] = None*, ***custom_headers_: Optional[str]*) → *GoodDataSdk*

Create common GoodDataApiClient and return new GoodDataSdk instance. Custom headers are filtered. Headers with None value are removed. It simplifies usage because headers can be created directly from optional values.

This is preferred way of creating GoodDataSdk, when no tweaks are needed.

3.2.6 gooddata_sdk.support

Classes

SupportService(api_client)	

gooddata_sdk.support.SupportService

class gooddata_sdk.support.**SupportService**(*api_client:* GoodDataApiClient)

Bases: `object`

__init__(*api_client:* GoodDataApiClient) → None

Methods

__init__(api_client)	
wait_till_available(timeout[, sleep_time])	Wait till GD.CN service is available.

Attributes

is_available	Checks if GD.CN is available.

property is_available: bool

Checks if GD.CN is available. Can raise exceptions in case of authentication or authorization failure.

Returns

True - available, False - not available

wait_till_available(*timeout: int*, *sleep_time: float = 2.0*) → None

Wait till GD.CN service is available. When timeout is:

- > 0 exception is raised after given number of seconds.
- = 0 exception is raised whe service is not available immediately
- < 0 no timeout

Method propagates is_available exceptions.

Parameters

- **timeout** – seconds to wait to service to be available (see method description for details)
- **sleep_time** – seconds to wait between GD.CN availability tests

3.2.7 gooddata_sdk.table

Classes

ExecutionTable(response, first_page)	Represents execution result as a table.
TableService(api_client)	The TableService provides a convenient way to drive computations and access the results in a tabular fashion.

gooddata_sdk.table.ExecutionTable

class gooddata_sdk.table.**ExecutionTable**(*response:* Execution, *first_page:* ExecutionResult)

Bases: object

Represents execution result as a table. This is a convenience wrapper for executions constructed using the following convention:

- all attributes are in the first dimension
- all metrics are in the second dimension
- if the execution is attribute- or metric-less, then there is always single dimension

The mapping to rows is then as follows:

- both attributes + metrics are on the execution = iteration over first dimension; as many rows as total records in the first dimension (paging.total[0])
- just attributes = iteration over just headers in first dimension; as many rows as total records in the first dimension (paging.total[0])
- just metrics = single row, all metrics values returned in one row

__init__(*response:* Execution, *first_page:* ExecutionResult) → None

Methods

__init__(response, first_page)	
read_all()	Returns a generator that will be yielding execution result as rows.

Attributes

attributes	
column_ids	Returns column identifiers.
column_metadata	Returns mapping of column identifier to definition of either attribute whose elements will be in that column or metric whose value will be calculated in that column.
metrics	

property column_ids: list[str]

Returns column identifiers. Each row will be a mapping of column identifier to column data.

property column_metadata: dict[str, Union[*Attribute*, *Metric*]]

Returns mapping of column identifier to definition of either attribute whose elements will be in that column or metric whose value will be calculated in that column.

read_all() → Generator[dict[str, Any], None, None]

Returns a generator that will be yielding execution result as rows. Each row is a dict() mapping column identifier to value of that column.

Returns

generator yielding dict() representing rows of the table

gooddata_sdk.table.TableService

class gooddata_sdk.table.**TableService**(*api_client:* GoodDataApiClient)

Bases: object

The TableService provides a convenient way to drive computations and access the results in a tabular fashion.

Compared to the ComputeService, with this one here you do not have to worry about the layout of the result and do not have to have to work with execution response, access the data using paging.

The ExecutionTable returned by the TableService allows you to iterate over the rows of the calculated data.

__init__(*api_client:* GoodDataApiClient) → None

Methods

__init__(api_client)	
for_insight(workspace_id, insight)	
for_items(workspace_id, items[, filters])	

3.2.8 gooddata_sdk.type_converter

Functions

build_stores()	Initialize both AttributeConverterStore and DBTypeConverterStore with Convertors.

gooddata_sdk.type_converter.build_stores

gooddata_sdk.type_converter.**build_stores**() → None

Initialize both AttributeConverterStore and DBTypeConverterStore with Convertors.

Classes

AttributeConverterStore()	Store for conversion of attributes
Converter()	Base Converter class.
ConverterRegistryStore()	Class store TypeConverterRegistry instances for each registered type.
DBTypeConverterStore()	Store for conversion of database types
DateConverter()	
DatetimeConverter()	
IntegerConverter()	
StringConverter()	
TypeConverterRegistry(type_name)	Class stores converters for given type with ability to distinguish converters based on sub-type granularity.

gooddata_sdk.type_converter.AttributeConverterStore

class gooddata_sdk.type_converter.**AttributeConverterStore**

Bases: *ConverterRegistryStore*

Store for conversion of attributes

__init__()

Methods

__init__()	
find_converter(type_name[, sub_type])	Find Converter for given type and sub type.
register(type_name, class_converter[, sub_types])	Register Converter instance created from provided Converter class to given type and list of sub types.
reset()	Reset converters setup

classmethod find_converter(*type_name: str*, *sub_type: Optional[str] = None*) → *Converter*

Find Converter for given type and sub type.

Parameters

- **type_name** – type name
- **sub_type** – sub type name

classmethod register(*type_name: str*, *class_converter: Type[*Converter*]*, *sub_types: Optional[list[str]] = None*) → None

Register Converter instance created from provided Converter class to given type and list of sub types. When sub types are not provided, converter is registered as the default one for given type.

Parameters

- **type_name** – type name
- **class_converter** – Converter class
- **sub_types** – list of sub types or None (default type Converter)

classmethod reset() → None

Reset converters setup

gooddata_sdk.type_converter.Converter

class gooddata_sdk.type_converter.**Converter**

Bases: object

Base Converter class. It defines Converter API and implements support for external type conversion. External type conversion provides ability to plug-in conversion function to Converter

__init__()

Methods

__init__()
db_data_type()
set_external_fnc(fnc)
to_external_type(value)
to_type(value)

Attributes

DEFAULT_DB_DATA_TYPE

gooddata_sdk.type_converter.ConverterRegistryStore

class gooddata_sdk.type_converter.**ConverterRegistryStore**

Bases: object

Class store TypeConverterRegistry instances for each registered type. It provides interface to register converters with type and sub-type and to find converter. The class is not meant to be used directly but as base class for child classes

__init__()

Methods

__init__()

find_converter(type_name[, sub_type])	Find Converter for given type and sub type.
register(type_name, class_converter[, sub_types])	Register Converter instance created from provided Converter class to given type and list of sub types.
reset()	Reset converters setup

classmethod find_converter(*type_name: str*, *sub_type: Optional[str] = None*) → *Converter*

Find Converter for given type and sub type.

Parameters

- **type_name** – type name
- **sub_type** – sub type name

classmethod register(*type_name: str*, *class_converter: Type[*Converter*]*, *sub_types: Optional[list[str]] = None*) → None

Register Converter instance created from provided Converter class to given type and list of sub types. When sub types are not provided, converter is registered as the default one for given type.

Parameters

- **type_name** – type name
- **class_converter** – Converter class
- **sub_types** – list of sub types or None (default type Converter)

classmethod reset() → None

Reset converters setup

gooddata_sdk.type_converter.DBTypeConverterStore

class gooddata_sdk.type_converter.**DBTypeConverterStore**

Bases: *ConverterRegistryStore*

Store for conversion of database types

__init__()

Methods

__init__()

find_converter(type_name[, sub_type])	Find Converter for given type and sub type.
register(type_name, class_converter[, sub_types])	Register Converter instance created from provided Converter class to given type and list of sub types.
reset()	Reset converters setup

classmethod find_converter(*type_name: str*, *sub_type: Optional[str] = None*) → *Converter*

Find Converter for given type and sub type.

Parameters

- **type_name** – type name
- **sub_type** – sub type name

classmethod register(*type_name: str*, *class_converter: Type[*Converter*]*, *sub_types: Optional[list[str]] = None*) → None

Register Converter instance created from provided Converter class to given type and list of sub types. When sub types are not provided, converter is registered as the default one for given type.

Parameters

- **type_name** – type name
- **class_converter** – Converter class
- **sub_types** – list of sub types or None (default type Converter)

classmethod reset() → None

Reset converters setup

gooddata_sdk.type_converter.DateConverter

class gooddata_sdk.type_converter.**DateConverter**

Bases: *Converter*

__init__()

Methods

__init__()	
db_data_type()	
set_external_fnc(fnc)	
to_date(value)	Add first month and first date to incomplete iso date string.
to_external_type(value)	
to_type(value)	

Attributes

DEFAULT_DB_DATA_TYPE

classmethod to_date(*value: str*) → date

Add first month and first date to incomplete iso date string.

```
>>> assert DateConverter.to_date("2021-01") == date(2021, 1, 1)
>>> assert DateConverter.to_date("1992") == date(1992, 1, 1)
```

gooddata_sdk.type_converter.DatetimeConverter

class gooddata_sdk.type_converter.**DatetimeConverter**

Bases: *Converter*

__init__()

Methods

__init__()	
db_data_type()	
set_external_fnc(fnc)	
to_datetime(value)	Append minutes to incomplete datetime string.
to_external_type(value)	
to_type(value)	

Attributes

DEFAULT_DB_DATA_TYPE

classmethod to_datetime(*value: str*) → datetime

Append minutes to incomplete datetime string.

```
>>> from datetime import datetime
>>> assert DatetimeConverter.to_datetime("2021-01-01 02") == datetime(2021, 1,␣
↪1, 2, 0)
>>> assert DatetimeConverter.to_datetime("2021-01-01 12:34") == datetime(2021,␣
↪1, 1, 12, 34)
```

gooddata_sdk.type_converter.IntegerConverter

class gooddata_sdk.type_converter.**IntegerConverter**

Bases: *Converter*

__init__()

Methods

__init__()
db_data_type()
set_external_fnc(fnc)
to_external_type(value)
to_type(value)

Attributes

DEFAULT_DB_DATA_TYPE

gooddata_sdk.type_converter.StringConverter

class gooddata_sdk.type_converter.**StringConverter**

Bases: *Converter*

__init__()

Methods

__init__()
db_data_type()
set_external_fnc(fnc)
to_external_type(value)
to_type(value)

Attributes

DEFAULT_DB_DATA_TYPE

gooddata_sdk.type_converter.TypeConverterRegistry

class gooddata_sdk.type_converter.**TypeConverterRegistry**(*type_name: str*)

Bases: object

Class stores converters for given type with ability to distinguish converters based on sub-type granularity.

__init__(*type_name: str*)

Initialize instance with type for which instance is going to be responsible

Parameters
type_name – type name

Methods

__init__(type_name)	Initialize instance with type for which instance is going to be responsible
converter(sub_type)	Find and return converter instance for a given sub-type.
register(converter, sub_type)	Register converter instance for given sub-type (granularity).

converter(*sub_type: Optional[str]*) → *Converter*

Find and return converter instance for a given sub-type. Default converter instance is returned if the sub-type is not found or not provided. When a default converter is not registered, ValueError exception is raised.

Parameters
sub_type – sub-type name

Returns
Converter instance

register(*converter:* Converter, *sub_type: Optional[str]*) → None

Register converter instance for given sub-type (granularity). If sub-type is not specified, converter is registered as the default one for the whole type. Default converter can be registered only once.

Parameters

- **converter** – converter instance
- **sub_type** – sub-type name

3.2.9 gooddata_sdk.utils

Functions

camel_to_snake(camel_case_str)	
change_case(dictionary, case)	
change_case_helper(value, case)	
create_directory(path)	
get_sorted_yaml_files(folder)	
id_obj_to_key(id_obj)	Given an object containing an id+type pair, this function will return a string key.
load_all_entities(get_page_func[, page_size])	Loads all entities from a paged resource.
load_all_entities_dict(get_page_func[, ...])	
read_layout_from_file(path)	
snake_to_camel(snake_case_str)	
write_layout_to_file(path, content)	

gooddata_sdk.utils.camel_to_snake

gooddata_sdk.utils.**camel_to_snake**(*camel_case_str: str*) → str

gooddata_sdk.utils.change_case

gooddata_sdk.utils.**change_case**(*dictionary: dict*, *case: Callable[[str], str]*) → dict

gooddata_sdk.utils.change_case_helper

gooddata_sdk.utils.**change_case_helper**(*value: Union[list, dict, str]*, *case: Callable[[str], str]*) → Union[list, dict, str]

gooddata_sdk.utils.create_directory

gooddata_sdk.utils.**create_directory**(*path: Path*) → None

gooddata_sdk.utils.get_sorted_yaml_files

gooddata_sdk.utils.**get_sorted_yaml_files**(*folder: Path*) → list[Path]

gooddata_sdk.utils.id_obj_to_key

gooddata_sdk.utils.**id_obj_to_key**(*id_obj: Union[str, ObjId, Dict[str, Dict[str, str]], Dict[str, str]]*) → str

Given an object containing an id+type pair, this function will return a string key.

For convenience, this also recognizes the *ref* format used by GoodData.UI SDK. In that format, the id+type are wrapped in 'identifier'.

Parameters
id_obj – id object

Returns
string that can be used as key

gooddata_sdk.utils.load_all_entities

gooddata_sdk.utils.**load_all_entities**(*get_page_func: functools.partial[Any]*, *page_size: int = 500*) → *AllPagedEntities*

Loads all entities from a paged resource. The primary input to this function is a partial function that is setup with all the fixed parameters. Given this the function will get entities page-by-page and merge them into a single 'pseudo-response' containing data and included attributes.

An example usage:

```
>>> import functools
>>> import gooddata_metadata_client as metadata_client
>>> import gooddata_metadata_client.apis as metadata_apis
>>> api = metadata_apis.EntitiesApi(metadata_client.ApiClient())
```

(continues on next page)

(continued from previous page)

```
>>> get_func = functools.partial(api.get_all_entities_visualization_objects, 'some-
↪workspace-id',
>>>                              include=["ALL"], _check_return_type=False)
>>> vis_objects = load_all_entities(get_func)
```

Parameters

- **get_page_func** – an API controller from the metadata client
- **page_size** – optionally specify page length, default is 500

gooddata_sdk.utils.load_all_entities_dict

gooddata_sdk.utils.**load_all_entities_dict**(*get_page_func: functools.partial[Any]*, *page_size: int = 500*, *camel_case: bool = False*) → dict[str, Any]

gooddata_sdk.utils.read_layout_from_file

gooddata_sdk.utils.**read_layout_from_file**(*path: Path*) → Any

gooddata_sdk.utils.snake_to_camel

gooddata_sdk.utils.**snake_to_camel**(*snake_case_str: str*) → str

gooddata_sdk.utils.write_layout_to_file

gooddata_sdk.utils.**write_layout_to_file**(*path: Path*, *content: Union[dict[str, Any], list[dict]]*) → None

Classes

AllPagedEntities(data, included)	
IndentDumper(stream[, default_style, ...])	
SideLoads(objs)	

gooddata_sdk.utils.AllPagedEntities

class gooddata_sdk.utils.**AllPagedEntities**(*data*, *included*)

Bases: tuple

__init__()

Methods

__init__()	

count(value, /)	Return number of occurrences of value.
index(value[, start, stop])	Return first index of value.

Attributes

data	Alias for field number 0
included	Alias for field number 1

count(*value*, */*)

Return number of occurrences of value.

property data

Alias for field number 0

property included

Alias for field number 1

index(*value*, *start=0*, *stop=9223372036854775807*, */*)

Return first index of value.

Raises ValueError if the value is not present.

gooddata_sdk.utils.IndentDumper

class gooddata_sdk.utils.**IndentDumper**(*stream*, *default_style=None*, *default_flow_style=False*, *canonical=None*, *indent=None*, *width=None*, *allow_unicode=None*, *line_break=None*, *encoding=None*, *explicit_start=None*, *explicit_end=None*, *version=None*, *tags=None*, *sort_keys=True*)

Bases: SafeDumper

__init__(*stream*, *default_style=None*, *default_flow_style=False*, *canonical=None*, *indent=None*, *width=None*, *allow_unicode=None*, *line_break=None*, *encoding=None*, *explicit_start=None*, *explicit_end=None*, *version=None*, *tags=None*, *sort_keys=True*)

Methods

__init__(stream[, default_style, ...])	
add_implicit_resolver(tag, regexp, first)	
add_multi_representer(data_type, representer)	
add_path_resolver(tag, path[, kind])	

continues on next page

Table 1 – continued from previous page

add_representer(data_type, representer)
analyze_scalar(scalar)
anchor_node(node)
