# **GoodData Pandas**

***Release 1.0.0***

**GoodData Corporation**

**Jul 14, 2022**

**CONTENTS:**

- 1 Installation 3**
  - 1.1 Requirements . . . . . 3
  - 1.2 Installation . . . . . 3
- 2 Examples 5**
  - 2.1 Series . . . . . 5
  - 2.2 Data Frames . . . . . 5
- 3 API 7**
  - 3.1 gooddata\_pandas . . . . . 7
  - 3.2 gooddata\_sdk . . . . . 16
- Python Module Index 187**
- Index 189**

GoodData Pandas contains a thin layer that utilizes GoodData Python SDK and allows you to conveniently create pandas series and data frames from the computations done against semantic model in your GoodData.CN workspace.

## INSTALLATION

### 1.1 Requirements

- Python 3.7 or newer
- GoodData.CN or GoodData Cloud

### 1.2 Installation

Run the following command to install the `gooddata-pandas` package on your system:

```
pip install gooddata-pandas
```

## EXAMPLES

Here are a couple of introductory examples how to create indexed and not-indexed series and data frames:

### 2.1 Series

```
from gooodata_pandas import GoodPandas

# GoodData.CN host in the form of uri eg. "http://localhost:3000"
host = "http://localhost:3000"
# GoodData.CN user token
token = "some_user_token"
# initialize the adapter to work on top of GD.CN host and use the provided_
↪ authentication token
gp = GoodPandas(host, token)

workspace_id = "demo"
series = gp.series(workspace_id)

# create indexed series
indexed_series = series.indexed(index_by="label/label_id", data_by="fact/measure_id")

# create non-indexed series containing just the values of measure sliced by elements of_
↪ the label
non_indexed = series.not_indexed(data_by="fact/measure_id", granularity="label/label_id")
```

### 2.2 Data Frames

```
from gooodata_pandas import GoodPandas

# GoodData.CN host in the form of uri eg. "http://localhost:3000"
host = "http://localhost:3000"
# GoodData.CN user token
token = "some_user_token"
# initialize the adapter to work on top of GD.CN host and use the provided_
↪ authentication token
gp = GoodPandas(host, token)
```

(continues on next page)

(continued from previous page)

```

workspace_id = "demo"
frames = gp.data_frames(workspace_id)

# create indexed data frame
indexed_df = frames.indexed(
    index_by="label/label_id",
    columns=dict(
        first_label='label/first_label_id',
        second_label='label/second_label_id',
        first_metric='metric/first_metric_id',
        second_metric='fact/fact_id'
    )
)

# create data frame with hierarchical index
indexed_df = frames.indexed(
    index_by=dict(first_label='label/first_label_id', second_label='label/second_label_id'
↪'),
    columns=dict(first_metric='metric/first_metric_id', second_metric='fact/fact_id')
)

# create non-indexed data frame
non_indexed_df = frames.not_indexed(
    columns=dict(
        first_label='label/first_label_id',
        second_label='label/second_label_id',
        first_metric='metric/first_metric_id',
        second_metric='fact/fact_id'
    )
)

# creates data frame based on the contents of the insight. if the insight contains ↪
↪labels and
# measures, the data frame will contain index or hierarchical index.
insight_df = frames.for_insight('insight_id')

# creates data frame based on the content of the items dict. if the dict contains both ↪
↪labels
# and measures, the frame will contain index or hierarchical index.
df = frames.for_items(
    items=dict(
        first_label='label/first_label_id',
        second_label='label/second_label_id',
        first_metric='metric/first_metric_id',
        second_metric='fact/fact_id'
    )
)

```

---

*gooddata\_pandas*

---

*gooddata\_sdk*

The *gooddata-sdk* package aims to provide clean and convenient Python APIs to interact with GoodData.CN.

---

## 3.1 gooddata\_pandas

### Modules

---

*gooddata\_pandas.data\_access*

---

*gooddata\_pandas.dataframe*

---

*gooddata\_pandas.good\_pandas*

---

*gooddata\_pandas.series*

---

*gooddata\_pandas.utils*

---

### 3.1.1 gooddata\_pandas.data\_access

#### Functions

---

*compute\_and\_extract*(sdk, workspace\_id, columns)

Convenience function to drive computation & data extraction on behalf of the series and data frame factories.

---

## gooddata\_pandas.data\_access.compute\_and\_extract

`gooddata_pandas.data_access.compute_and_extract`(*sdk*: `GoodDataSdk`, *workspace\_id*: *str*, *columns*: *ColumnsDef*, *index\_by*: *Optional[IndexDef]* = *None*, *filter\_by*: *Optional[Union[Filter, list[Filter]]]* = *None*) → *tuple[dict, dict]*

Convenience function to drive computation & data extraction on behalf of the series and data frame factories.

Given data columns and index columns, this function will create AFM execution and then read the results and populate data and index dicts.

For each column in *columns*, the returned data will contain key under which there is array of data for that column. For each index in *index\_by*, the returned data will contain key under which there is array with data to construct the index. When there are multiple indexes, feed the indexes to `MultiIndex.from_arrays()`.

Note that as convenience it is possible to pass just single index. in that case the index dict will contain exactly one key of '0' (just get first value from dict when consuming the result).

## Classes

---

`ExecutionDefinitionBuilder`(*columns*[], *index\_by*[])

---

## gooddata\_pandas.data\_access.ExecutionDefinitionBuilder

**class** `gooddata_pandas.data_access.ExecutionDefinitionBuilder`(*columns*: *Dict[str, Union[Attribute, Metric, ObjId, str]]*, *index\_by*: *Optional[Union[Attribute, ObjId, str, Dict[str, Union[Attribute, ObjId, str]]]]* = *None*)

Bases: `object`

**\_\_init\_\_**(*columns*: *Dict[str, Union[Attribute, Metric, ObjId, str]]*, *index\_by*: *Optional[Union[Attribute, ObjId, str, Dict[str, Union[Attribute, ObjId, str]]]]* = *None*) → *None*

## Methods

---

`__init__`(*columns*[], *index\_by*[])

---

`build_execution_definition`(*filter\_by*)

---

## Attributes

---

col\_to\_attr\_idx

---

col\_to\_metric\_idx

---

index\_to\_attr\_idx

---

### 3.1.2 gooddata\_pandas.dataframe

#### Classes

---

|                                                  |                                               |
|--------------------------------------------------|-----------------------------------------------|
| <code>DataFrameFactory(sdk, workspace_id)</code> | Factory to create pandas.DataFrame instances. |
|--------------------------------------------------|-----------------------------------------------|

---

#### gooddata\_pandas.dataframe.DataFrameFactory

**class** gooddata\_pandas.dataframe.DataFrameFactory(*sdk*: [GoodDataSdk](#), *workspace\_id*: *str*)

Bases: object

Factory to create pandas.DataFrame instances.

There are several methods in place that should provide for convenient construction of data frames:

- `indexed()` - calculate measure values sliced by one or more labels, indexed by those labels
- **`not_indexed()` - calculate measure values sliced by one or more labels, but not indexed by those labels,**  
label values will be part of the DataFrame and will be in the same row as the measure values calculated for them
- **`for_items()` - calculate measure values for a one or more items which may be labels or measures.**  
**Depending**  
what items you specify, this method will create DataFrame with or without index
- **`for_insight()` - calculate DataFrame for insight created by GoodData.CN Analytical Designer.**  
**Depending**  
on what items are in the insight, this method will create DataFrame with or without index.

Note that all of these methods have additional levels of convenience and flexibility so their purpose is not limited to just what is listed above.

`__init__`(*sdk*: [GoodDataSdk](#), *workspace\_id*: *str*) → None

## Methods

|                                                        |                                                                                                     |
|--------------------------------------------------------|-----------------------------------------------------------------------------------------------------|
| <code>__init__(sdk, workspace_id)</code>               |                                                                                                     |
| <code>for_insight(insight_id[, auto_index])</code>     | Creates a data frame with columns based on the content of the insight with the provided identifier. |
| <code>for_items(items[, filter_by, auto_index])</code> | Creates a data frame for a named items.                                                             |
| <code>indexed(index_by, columns[, filter_by])</code>   | Creates a data frame indexed by values of the label.                                                |
| <code>not_indexed(columns[, filter_by])</code>         | Creates a data frame with columns created from metrics and or labels.                               |

**for\_insight**(*insight\_id*: str, *auto\_index*: bool = True) → DataFrame

Creates a data frame with columns based on the content of the insight with the provided identifier. The filters that are set on the insight will be applied and used for the server-side computation of the data for the data frame.

This method will create DataFrame with or without index - depending on the contents of the insight. The rules are as follows:

- **if the insight contains both attributes and measures, it will be mapped to a DataFrame with index**
  - if there are multiple attributes, hierarchical index (pandas.MultiIndex) will be used
  - otherwise a normal index will be used (pandas.Index)
  - you can use the option 'auto\_index' argument to disable this logic and force no indexing
- if the insight contains either only attributes or only measures, then DataFrame will not be indexed and all attribute or measures values will be used as data.

Note that if the insight consists of single measure only, the resulting data frame is guaranteed to have single 'row' of data with one column per measure.

### Parameters

- **insight\_id** – insight identifier
- **auto\_index** – optionally force creation of DataFrame without index even if the data in the insight is eligible for indexing

### Returns

pandas dataframe instance

**for\_items**(*items*: ColumnsDef, *filter\_by*: Optional[Union[Filter, list[Filter]]] = None, *auto\_index*: bool = True) → pandas.DataFrame

Creates a data frame for a named items. This is a convenience method that will create DataFrame with or without index based on the context of the items that you pass.

- **If items contain labels and measures, then DataFrame with index will be created. If there is more than one label among the items, then hierarchical index will be created.**  
You can turn this behavior using 'auto\_index' parameter.
- Otherwise DataFrame without index will be created and will contain column per item.

You may also optionally specify filters to apply during the computation on the server.

### Parameters

- **items** – dict mapping item name to its definition; item may be specified as: - object identifier: `ObjId(id='some_id', type='<type>')` - where type is either 'label', 'fact' or 'metric' - string representation of object identifier: `'<type>/some_id'` - where type is either 'label', 'fact' or 'metric' - Attribute object used in the compute model: `Attribute(local_id=..., label='some_label_id')` - subclass of Measure object used in the compute model: `SimpleMeasure`, `PopDateMeasure`, `PopDatasetMeasure`, `ArithmeticMeasure`
- **filter\_by** – optionally specify filters to apply during computation on the server, reference to filtering column can be one of: - string reference to item key - object identifier in string form - object identifier: `ObjId(id='some_label_id', type='<type>')` - Attribute or Metric depending on type of filter
- **auto\_index** – optionally force creation of DataFrame without index even if the contents of items make it eligible for indexing

**Returns**

pandas dataframe instance

**indexed**(*index\_by: IndexDef, columns: ColumnsDef, filter\_by: Optional[Union[Filter, list[Filter]]] = None*)  
→ pandas.DataFrame

Creates a data frame indexed by values of the label. The data frame columns will be created from either metrics or other label values.

The computation to obtain data from GoodData.CN workspace will use all labels that you specify for both indexing and in columns to aggregate values of metric columns.

Note that depending on composition of the labels, the DataFrame's index may or may not be unique.

**Parameters**

- **index\_by** – one or more labels to index by; specify either: - string with reference to columns key - only attribute can be referenced - string with id: `'some_label_id'`, - string representation of object identifier: `'label/some_label_id'` - object identifier: `ObjId(id='some_label_id', type='label')`, - or an Attribute object used in the compute model: `Attribute(local_id=..., label='some_label_id')`, - dict containing mapping of index name to label to use for indexing - specified in one of the ways list above
- **columns** – dict mapping column name to its definition; column may be specified as: - object identifier: `ObjId(id='some_id', type='<type>')` - where type is either 'label', 'fact' or 'metric' - string representation of object identifier: `'<type>/some_id'` - where type is either 'label', 'fact' or 'metric' - Attribute object used in the compute model: `Attribute(local_id=..., label='some_label_id')` - subclass of Measure object used in the compute model: `SimpleMeasure`, `PopDateMeasure`, `PopDatasetMeasure`, `ArithmeticMeasure`
- **filter\_by** – optional filters to apply during computation on the server, reference to filtering column can be one of: - string reference to column key or index key - object identifier in string form - object identifier: `ObjId(id='some_label_id', type='<type>')` - Attribute or Metric depending on type of filter

**Returns**

pandas dataframe instance

**not\_indexed**(*columns: ColumnsDef, filter\_by: Optional[Union[Filter, list[Filter]]] = None*) →  
pandas.DataFrame

Creates a data frame with columns created from metrics and or labels.

The computation to obtain data from GoodData.CN workspace will use all labels that you specify for both columns to aggregate values of metric columns.

**Parameters**

- **columns** – dict mapping column name to its definition; column may be specified as: - object identifier: `ObjId(id='some_id', type='<type>')` - where type is either 'label', 'fact' or 'metric' - string representation of object identifier: `'<type>/some_id'` - where type is either 'label', 'fact' or 'metric' - Attribute object used in the compute model: `Attribute(local_id=..., label='some_label_id')` - subclass of Measure object used in the compute model: `SimpleMeasure`, `PopDateMeasure`, `PopDatasetMeasure`, `ArithmeticMeasure`
- **filter\_by** – optionally specify filters to apply during computation on the server, reference to filtering column can be one of: - string reference to column key - object identifier in string form - object identifier: `ObjId(id='some_label_id', type='<type>')` - Attribute or Metric depending on type of filter

**Returns**

pandas dataframe instance

### 3.1.3 gooddata\_pandas.good\_pandas

**Module Attributes**

---

|                         |                                                                                                   |
|-------------------------|---------------------------------------------------------------------------------------------------|
| <code>USER_AGENT</code> | Extra segment of the User-Agent header that will be appended to standard gooddata-sdk user agent. |
|-------------------------|---------------------------------------------------------------------------------------------------|

---

**gooddata\_pandas.good\_pandas.USER\_AGENT**

`gooddata_pandas.good_pandas.USER_AGENT = 'gooddata-pandas/1.0.0'`

Extra segment of the User-Agent header that will be appended to standard gooddata-sdk user agent.

**Classes**

---

|                                                      |                                                                                                              |
|------------------------------------------------------|--------------------------------------------------------------------------------------------------------------|
| <code>GoodPandas(host, token[, headers_host])</code> | Facade to access factories that create pandas Series and DataFrames using analytics computed by GoodData.CN. |
|------------------------------------------------------|--------------------------------------------------------------------------------------------------------------|

---

**gooddata\_pandas.good\_pandas.GoodPandas**

**class** `gooddata_pandas.good_pandas.GoodPandas`(*host: str, token: str, headers\_host: Optional[str] = None*)

Bases: `object`

Facade to access factories that create pandas Series and DataFrames using analytics computed by GoodData.CN.

`__init__`(*host: str, token: str, headers\_host: Optional[str] = None*) → `None`

## Methods

---

|                                                    |                                                              |
|----------------------------------------------------|--------------------------------------------------------------|
| <code>__init__(host, token[, headers_host])</code> |                                                              |
| <code>data_frames(workspace_id)</code>             | Creates factory to use for construction of pandas.DataFrame. |
| <code>series(workspace_id)</code>                  | Creates factory to use for construction of pandas.Series.    |

---

**data\_frames**(workspace\_id: str) → DataFrameFactory

Creates factory to use for construction of pandas.DataFrame.

### Parameters

**workspace\_id** – workspace to which the factory will be bound

### Returns

always one same instance for given workspace

**series**(workspace\_id: str) → SeriesFactory

Creates factory to use for construction of pandas.Series.

### Parameters

**workspace\_id** – workspace to which the factory will be bound

### Returns

always one same instance for given workspace

## 3.1.4 gooddata\_pandas.series

### Classes

---

|                                               |
|-----------------------------------------------|
| <code>SeriesFactory(sdk, workspace_id)</code> |
|-----------------------------------------------|

---

### gooddata\_pandas.series.SeriesFactory

**class** gooddata\_pandas.series.SeriesFactory(sdk: GoodDataSdk, workspace\_id: str)

Bases: object

**\_\_init\_\_**(sdk: GoodDataSdk, workspace\_id: str) → None

### Methods

---

|                                                             |                                                                                                                                              |
|-------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| <code>__init__(sdk, workspace_id)</code>                    |                                                                                                                                              |
| <code>indexed(index_by, data_by[, filter_by])</code>        | Creates pandas Series from data points calculated from a single <i>data_by</i> that will be computed on granularity of the index labels.     |
| <code>not_indexed(data_by[, granularity, filter_by])</code> | Creates pandas Series from data points calculated from a single <i>data_by</i> that will be computed on granularity of the specified labels. |

---

**indexed**(*index\_by*: IndexDef, *data\_by*: Union[SimpleMetric, str, ObjId, Attribute], *filter\_by*: Optional[Union[Filter, list[Filter]]] = None) → pandas.Series

Creates pandas Series from data points calculated from a single *data\_by* that will be computed on granularity of the index labels. The elements of the index labels will be used to construct simple or hierarchical index.

#### Parameters

- **index\_by** – label to index by; specify either:
  - string with id: 'some\_label\_id',
  - object identifier: ObjId(id='some\_label\_id', type='label'),
  - string representation of object identifier: 'label/some\_label\_id'
  - or an Attribute object used in the compute model: Attribute(local\_id=..., label='some\_label\_id')
  - dict containing mapping of index name to label to use for indexing - specified in one of the ways list above
- **data\_by** – label, fact or metric to that will provide data (metric values or label elements); specify either:
  - object identifier: ObjId(id='some\_id', type='<type>') - where type is either 'label', 'fact' or 'metric'
  - string representation of object identifier: '<type>/some\_id' - where type is either 'label', 'fact' or 'metric'
  - Attribute object used in the compute model: Attribute(local\_id=..., label='some\_label\_id')
  - SimpleMetric object used in the compute model: SimpleMetric(local\_id=..., item=..., aggregation=...)
- **filter\_by** – optionally specify filter to apply during computation on the server, reference to filtering column can be one of:
  - string reference to index key - object identifier in string form
  - object identifier: ObjId(id='some\_label\_id', type='<type>') - Attribute or Metric depending on type of filter

:return pandas series instance

**not\_indexed**(*data\_by*: Union[SimpleMetric, str, ObjId, Attribute], *granularity*: Union[list[LabelItemDef], IndexDef] = None, *filter\_by*: Optional[Union[Filter, list[Filter]]] = None) → pandas.Series

Creates pandas Series from data points calculated from a single *data\_by* that will be computed on granularity of the specified labels. No index will be constructed.

Note that *data\_by* may also be a label in which case the Series will contain label elements.

#### Parameters

- **data\_by** – label, fact or metric to get data from; specify either:
  - object identifier: ObjId(id='some\_id', type='<type>') - where type is either 'label', 'fact' or 'metric'
  - string representation of object identifier: '<type>/some\_id' - where type is either 'label', 'fact' or 'metric'
  - Attribute object used in the compute model: Attribute(local\_id=..., label='some\_label\_id')

- SimpleMetric object used in the compute model: SimpleMetric(local\_id=..., item=..., aggregation=...)
- **granularity** – optionally specify label to slice the metric by; specify either:
  - string with id: 'some\_label\_id',
  - object identifier: ObjId(id='some\_label\_id', type='label'),
  - string representation of object identifier: 'label/some\_label\_id'
  - or an Attribute object used in the compute model: Attribute(local\_id=..., label='some\_label\_id')
  - list containing multiple labels to slice the metric by - specified in one of the ways list above
  - dict containing mapping of index name to label to use for indexing - specified in one of the ways list above; this option is available so that you can easily switch from indexed factory method to this one if needed
- **filter\_by** – optionally specify filter to apply during computation on the server, reference to filtering column can be one of:
  - object identifier in string form - object identifier: ObjId(id='some\_label\_id', type='<type>')
  - Attribute or Metric depending on type of filter

:return pandas series instance

### 3.1.5 gooddata\_pandas.utils

#### Functions

---

*make\_pandas\_index(index)*

---

#### gooddata\_pandas.utils.make\_pandas\_index

gooddata\_pandas.utils.make\_pandas\_index(index: dict) → Optional[Union[Index, MultiIndex]]

#### Classes

---

*DefaultInsightColumnNaming()*

---

#### gooddata\_pandas.utils.DefaultInsightColumnNaming

**class** gooddata\_pandas.utils.DefaultInsightColumnNaming

Bases: object

**\_\_init\_\_**() → None

## Methods

---

`__init__()`

---

`col_name_for_attribute(attr)`

---

`col_name_for_metric(measure)`

---

## 3.2 gooddata\_sdk

The *gooddata-sdk* package aims to provide clean and convenient Python APIs to interact with GoodData.CN.

At the moment the SDK provides services to inspect and interact with the Semantic Model and consume analytics.

## Modules

---

`gooddata_sdk.catalog`

---

`gooddata_sdk.client`

Module containing a class that provides access to meta-data and afm services.

---

`gooddata_sdk.compute`

---

`gooddata_sdk.insight`

---

`gooddata_sdk.sdk`

---

`gooddata_sdk.support`

---

`gooddata_sdk.table`

---

`gooddata_sdk.type_converter`

---

`gooddata_sdk.utils`

---

### 3.2.1 gooddata\_sdk.catalog

#### Modules

---

*gooddata\_sdk.catalog.base*

---

*gooddata\_sdk.catalog.catalog\_service\_base*

---

*gooddata\_sdk.catalog.data\_source*

---

*gooddata\_sdk.catalog.entity*

---

*gooddata\_sdk.catalog.identifier*

---

*gooddata\_sdk.catalog.organization*

---

*gooddata\_sdk.catalog.permission*

---

*gooddata\_sdk.catalog.types*

---

*gooddata\_sdk.catalog.user*

---

*gooddata\_sdk.catalog.workspace*

---

#### gooddata\_sdk.catalog.base

#### Functions

---

*value\_in\_allowed*(instance, attribute, value)

---

#### gooddata\_sdk.catalog.base.value\_in\_allowed

`gooddata_sdk.catalog.base.value_in_allowed`(*instance*: *Type*[Base], *attribute*: *Attribute*, *value*: *str*) →  
None

#### Classes

---

*Base*()

---

**gooddata\_sdk.catalog.base.Base****class** gooddata\_sdk.catalog.base.Base

Bases: object

**\_\_init\_\_**() → None

Method generated by attrs for class Base.

**Methods**

| <code><a href="#">to_dict</a>([camel_case])</code>         | Converts object into dictionary.                                                      |

**classmethod** `from\_api(entity: Dict[str, Any])` → T

Creates object from entity passed by client class, which represents it as dictionary.

**classmethod** `from\_dict(data: Dict[str, Any], camel_case: bool = True)` → T

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake\_case.

**to\_dict**(camel\_case: bool = True) → Dict[str, Any]

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake\_case can be specified.

**classmethod** `from_api(entity: Dict[str, Any]) → T`

Creates object from entity passed by client class, which represents it as dictionary.

**classmethod** `from_dict(data: Dict[str, Any], camel_case: bool = True) → T`

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake\_case.

**to\_dict**(`camel_case: bool = True`) → Dict[str, Any]

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake\_case can be specified.

## `gooddata_sdk.catalog.data_source.declarative_model.data_source.CatalogDeclarativeDataSources`

**class** `gooddata_sdk.catalog.data_source.declarative_model.data_source.CatalogDeclarativeDataSources(*, data_sources: List[CatalogDeclarativeDataSource])`

Bases: `Base`

**\_\_init\_\_**(\*`, data_sources: List[CatalogDeclarativeDataSource]`) → None

Method generated by attrs for class CatalogDeclarativeDataSources.

### Methods

| <code>to_dict([camel_case])</code>                           | Converts object into dictionary.                                                      |

### Attributes

|                           |
|---------------------------|
| <code>data_sources</code> |
|---------------------------|

**classmethod** `from_api(entity: Dict[str, Any]) → T`

Creates object from entity passed by client class, which represents it as dictionary.

**classmethod** `from_dict(data: Dict[str, Any], camel_case: bool = True) → T`

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake\_case.

**to\_dict**(*camel\_case: bool = True*) → Dict[str, Any]

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake\_case can be specified.

**classmethod** `from_api(entity: Dict[str, Any]) → T`

Creates object from entity passed by client class, which represents it as dictionary.

**classmethod** `from_dict(data: Dict[str, Any], camel_case: bool = True) → T`

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake\_case.

**to\_dict**(`camel_case: bool = True`) → Dict[str, Any]

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake\_case can be specified.

| <code>id</code>   |
| <code>type</code> |

**classmethod** `from_api`(entity: Dict[str, Any]) → T

Creates object from entity passed by client class, which represents it as dictionary.

**classmethod** `from_dict`(data: Dict[str, Any], camel\_case: bool = True) → T

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake\_case.

**to\_dict**(camel\_case: bool = True) → Dict[str, Any]

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake\_case can be specified.

**gooddata\_sdk.catalog.identifier.CatalogGrainIdentifier**

**class** gooddata\_sdk.catalog.identifier.CatalogGrainIdentifier(\*, id: str, type: str)

Bases: *Base*

**\_\_init\_\_**(\*, id: str, type: str) → None

Method generated by attrs for class CatalogGrainIdentifier.

**classmethod** **from\_api**(*entity: Dict[str, Any]*) → T

Creates object from entity passed by client class, which represents it as dictionary.

**classmethod** **from\_dict**(*data: Dict[str, Any], camel\_case: bool = True*) → T

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake\_case.

**to\_dict**(*camel\_case: bool = True*) → Dict[str, Any]

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake\_case can be specified.

|------------------------|

**classmethod** `from_api(entity: Dict[str, Any]) → T`

Creates object from entity passed by client class, which represents it as dictionary.

**classmethod** `from_dict(data: Dict[str, Any], camel_case: bool = True) → T`

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake\_case.

**to\_dict(camel\_case: bool = True) → Dict[str, Any]**

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake\_case can be specified.

`gooddata_sdk.catalog.workspace.declarative_model.workspace.analytics_model.analytics_model.CatalogDeclarativeAnalyticsLayer`

`class gooddata_sdk.catalog.workspace.declarative_model.workspace.analytics_model.analytics_model.CatalogDeclarativeAnalyticsLayer`

Bases: `Base`

```
__init__(*, analytical_dashboards: List[CatalogDeclarativeAnalyticalDashboard] = [], dashboard_plugins:  
List[CatalogDeclarativeDashboardPlugin] = [], filter_contexts:  
List[CatalogDeclarativeFilterContext] = [], metrics: List[CatalogDeclarativeMetric] = [],  
visualization_objects: List[CatalogDeclarativeVisualizationObject] = []) → None
```

Method generated by attrs for class `CatalogDeclarativeAnalyticsLayer`.

**classmethod** `from_api(entity: Dict[str, Any]) → T`

Creates object from entity passed by client class, which represents it as dictionary.

**classmethod** `from_dict(data: Dict[str, Any], camel_case: bool = True) → T`

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake\_case.

**to\_dict** `(camel_case: bool = True) → Dict[str, Any]`

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake\_case can be specified.

**classmethod** `from_api(entity: Dict[str, Any]) → T`

Creates object from entity passed by client class, which represents it as dictionary.

**classmethod** `from_dict(data: Dict[str, Any], camel_case: bool = True) → T`

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake\_case.

**to\_dict**(`camel_case: bool = True`) → Dict[str, Any]

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake\_case can be specified.

---

`column_name`

---

`workspace_data_filter_settings`

---

`description`

---

`workspace`

---

**classmethod** `from_api`(*entity: Dict[str, Any]*) → T

Creates object from entity passed by client class, which represents it as dictionary.

**classmethod** `from_dict`(*data: dict[str, Any]*, *camel\_case: bool = True*) →  
*CatalogDeclarativeWorkspaceDataFilter*

### Parameters

- **data** – Data loaded for example from the file.
- **camel\_case** – True if the variable names in the input data are serialized names as specified in the OpenAPI document. False if the variables names in the input data are python variable names in PEP-8 snake case.

### Returns

CatalogDeclarativeWorkspaceDataFilter object.

**to\_dict**(*camel\_case: bool = True*) → Dict[str, Any]

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake\_case can be specified.

`gooddata_sdk.catalog.workspace.declarative_model.workspace.workspace.CatalogDeclarativeWorkspaceDataFilterSetting`

`class gooddata_sdk.catalog.workspace.declarative_model.workspace.workspace.CatalogDeclarativeWorkspaceDataFilterSetting`

Bases: `Base`

`__init__`(\**id*: *str*, *title*: *str*, *filter\_values*: *List[str]*, *workspace*: `CatalogWorkspaceIdentifier`, *description*: *Optional[str]* = *None*) → *None*

Method generated by attrs for class `CatalogDeclarativeWorkspaceDataFilterSetting`.

## Methods

**filter\_dataset**(*valid\_objects: Dict[str, Set[str]]*) → Optional[*CatalogDataset*]

Filters dataset so that it contains only attributes and facts that are part of the provided valid objects structure.

### Parameters

**valid\_objects** – mapping of object type to a set of valid object ids

### Returns

CatalogDataset containing only valid attributes and facts; None if all of the attributes and facts were filtered out

## Attributes

|                       |  |
|-----------------------|--|
| <code>datasets</code> |  |
| <code>metrics</code>  |  |

`catalog_with_valid_objects`(*ctx*: *Union*[*Attribute*, *Metric*, *Filter*, *CatalogLabel*, *CatalogFact*, *CatalogMetric*, *List*[*Union*[*Attribute*, *Metric*, *Filter*, *CatalogLabel*, *CatalogFact*, *CatalogMetric*]], *ExecutionDefinition*) → *CatalogWorkspaceContent*

Returns a new instance of catalog which contains only those datasets (attributes and facts) that are valid in the provided context. The context is composed of one more more entities of the semantic model and the filtered catalog will contain only those entities that can be safely added on top of that existing context.

### Parameters

**ctx** – existing context. you can specify context in one of the following ways: - single item or list of items from the execution model - single item or list of items from catalog model; catalog fact, label or metric may be added - the entire execution definition that is used to compute analytics

### Returns

`find_label_attribute`(*id\_obj*: *Union*[*str*, *ObjId*, *Dict*[*str*, *Dict*[*str*, *str*]], *Dict*[*str*, *str*]]) → *Optional*[*CatalogAttribute*]

Get attribute by label id.

`get_dataset`(*dataset\_id*: *Union*[*str*, *ObjId*]) → *Optional*[*CatalogDataset*]

Gets dataset by id. The id can be either an instance of *ObjId* or string containing serialized *ObjId* ('dataset/some.dataset.id') or contain just the id part ('some.dataset.id').

### Parameters

**dataset\_id** – fully qualified dataset entity id (type/id) or just the identifier of dataset entity

### Returns

instance of *CatalogDataset* or *None* if no such dataset in catalog

:rtype CatalogDataset

**get\_metric**(*metric\_id*: Union[str, ObjId]) → Optional[CatalogMetric]

Gets metric by id. The id can be either an instance of ObjId or string containing serialized ObjId ('metric/some.metric.id') or contain just the id part ('some.metric.id').

**Parameters**

**metric\_id** – fully qualified metric entity id (type/id) or just the identifier of metric entity

**Returns**

instance of CatalogMetric or None if no such metric in catalog

:rtype CatalogMetric

## Attributes

---

organization\_id

---

**compute\_valid\_objects**(workspace\_id: str, ctx: Union[Attribute, Metric, Filter, CatalogLabel, CatalogFact, CatalogMetric, List[Union[Attribute, Metric, Filter, CatalogLabel, CatalogFact, CatalogMetric]], ExecutionDefinition]) → Dict[str, Set[str]]

Returns attributes, facts, and metrics which are valid to add to a context that already contains some entities from the semantic model. The entities are typically used to compute analytics and come from the execution definition. You may, however, specify the entities through different layers of convenience.

### Parameters

- **workspace\_id** – workspace identifier
- **ctx** – items already in context. you can specify context in one of the following ways: - single item or list of items from the execution model - single item or list of items from catalog model; catalog fact, label or metric may be added - the entire execution definition that is used to compute analytics

### Returns

a dict of sets; type of available object is used as key in the dict, the value is a set containing id's of available items

**get\_full\_catalog**(workspace\_id: str) → *CatalogWorkspaceContent*

Retrieves catalog for a workspace. Catalog contains all data sets and metrics defined in that workspace.

### Parameters

**workspace\_id** – workspace identifier

### Returns

## gooddata\_sdk.catalog.workspace.service.CatalogWorkspaceService

**class** gooddata\_sdk.catalog.workspace.service.CatalogWorkspaceService(*api\_client*: GoodDataApiClient)

Bases: *CatalogServiceBase*

**\_\_init\_\_**(*api\_client*: GoodDataApiClient) → None

## Methods

## Attributes

---

`organization_id`

---

**delete\_workspace**(*workspace\_id: str*) → None

This method is implemented according to our implementation of delete workspace, which returns HTTP 204 no matter if the workspace\_id exists.

**get\_workspace**(*workspace\_id: str*) → *CatalogWorkspace*

Gets workspace content and returns it as CatalogWorkspace object. :param workspace\_id: An input string parameter of workspace id. :return: CatalogWorkspace object containing structure of workspace.

## 3.2.2 gooddata\_sdk.client

Module containing a class that provides access to metadata and afm services.

### Classes

---

|                                               |                                              |
|-----------------------------------------------|----------------------------------------------|
| <i>GoodDataApiClient</i> (host, token[, ...]) | Provide access to metadata and afm services. |
|-----------------------------------------------|----------------------------------------------|

---

### gooddata\_sdk.client.GoodDataApiClient

**class** gooddata\_sdk.client.**GoodDataApiClient**(*host: str, token: str, custom\_headers: Optional[dict[str, str]] = None, extra\_user\_agent: Optional[str] = None*)

Bases: object

Provide access to metadata and afm services.

**\_\_init\_\_**(*host: str, token: str, custom\_headers: Optional[dict[str, str]] = None, extra\_user\_agent: Optional[str] = None*) → None

Take url, token for connecting to GoodData.CN.

HTTP requests made by this class may be enriched by *custom\_headers* dict containing header names as keys and header values as dict values.

*extra\_user\_agent* is optional string to be added to default http User-Agent header. This takes precedence over *custom\_headers* setting.

### Methods

---

|                                                      |                                                |

---

**gooddata\_sdk.compute.model.attribute.Attribute**

**class** gooddata\_sdk.compute.model.attribute.**Attribute**(*local\_id*: str, *label*: Union[ObjId, str])

Bases: *ExecModelEntity*

**\_\_init\_\_**(*local\_id*: str, *label*: Union[ObjId, str]) → None

Creates new attribute that can be used to slice or dice metric values during computation.

**Parameters**

- **local\_id** – identifier of the attribute within the execution
- **label** – identifier of the label to use for slicing or dicing; specified either as ObjId or str containing the label id

**Methods**

|                                        |                                                                                           |

## gooddata\_sdk.compute.model.execution.compute\_model\_to\_api\_model

`gooddata_sdk.compute.model.execution.compute_model_to_api_model(attributes: Optional[list[Attribute]] = None, metrics: Optional[list[Metric]] = None, filters: Optional[list[Filter]] = None) → models.AFM`

Transforms categorized execution model entities (attributes, metrics, facts) into an API model that can be used for computations of data results or computations of object availability.

### Parameters

- **attributes** – optionally specify list of attributes
- **metrics** – optionally specify list of metrics
- **filters** – optionally specify list of filters

## Returns

## Classes

---

*ExecutionDefinition*(attributes, metrics, ...)

---

*ExecutionResponse*(actions\_api, workspace\_id, ...)

---

*ExecutionResult*(result)

---

## `gooddata_sdk.compute.model.execution.ExecutionDefinition`

```
class gooddata_sdk.compute.model.execution.ExecutionDefinition(attributes:
                                                                Optional[list[Attribute]], metrics:
                                                                Optional[list[Metric]], filters:
                                                                Optional[list[Filter]], dimensions:
                                                                list[Optional[list[str]]])
```

Bases: object

```
__init__(attributes: Optional[list[Attribute]], metrics: Optional[list[Metric]], filters: Optional[list[Filter]],
          dimensions: list[Optional[list[str]]]) → None
```

**gooddata\_sdk.compute.model.filter.AllTimeFilter****class** gooddata\_sdk.compute.model.filter.AllTimeFilterBases: *Filter*

Filter that is semantically equivalent to absent filter.

This filter exists because ‘All time filter’ retrieved from GoodData.CN is non-standard as it does not have *from* and *to* fields; this is also the reason why *as\_api\_model* method is not implemented - it would lead to invalid object.

The main feature of this filter is noop.

*time\_comparison\_master*

If this is a time comparison metric, return local\_id of the master metric from which it is derived.

---

title

---

**property time\_comparison\_master:** Optional[str]

If this is a time comparison metric, return local\_id of the master metric from which it is derived. :return: local\_id of master metric, None if not a time comparison metric

## gooddata\_sdk.insight.InsightService

**class** gooddata\_sdk.insight.InsightService(*api\_client*: GoodDataApiClient)

Bases: object

Insight Service allows retrieval of insights from a GD.CN workspace. The insights are returned as instances of Insight which allows convenient introspection and necessary functions to convert the insight into a form where it can be sent for computation.

Note: the insights are created using GD.CN Analytical Designer or using GoodData.UI SDK. They are stored as visualization objects with a free-form body. This body is specific for AD & SDK. The Insight wrapper exists to take care of these discrepancies.

**\_\_init\_\_**(*api\_client*: GoodDataApiClient) → None

## Methods

---

**\_\_init\_\_**(*api\_client*)

---

**get\_insight**(*workspace\_id*, *insight\_id*)

Gets a single insight from a workspace.

---

**get\_insights**(*workspace\_id*)

Gets all insights for a workspace.

---

**get\_insight**(*workspace\_id*: str, *insight\_id*: str) → *Insight*

Gets a single insight from a workspace.

### Parameters

- **workspace\_id** – identifier of workspace to load insight from
- **insight\_id** – identifier of the insight

### Returns

single insight; the insight will contain sideloaded metadata about the entities it references

### Return type

*Insight*

**get\_insights**(*workspace\_id*: str) → list[*Insight*]

Gets all insights for a workspace. The insights will contain side loaded metadata for all execution entities that they reference.

### Parameters

**workspace\_id** – identifier of workspace to load insights from

### Returns

all available insights, each insight will contain side loaded metadata about the entities it references

### 3.2.5 gooddata\_sdk.sdk

#### Classes

|                                  |                                                            |
|----------------------------------|------------------------------------------------------------|
| <code>GoodDataSdk(client)</code> | Top-level class that wraps all the functionality together. |
|----------------------------------|------------------------------------------------------------|

#### gooddata\_sdk.sdk.GoodDataSdk

**class** gooddata\_sdk.sdk.GoodDataSdk(*client*: GoodDataApiClient)

Bases: object

Top-level class that wraps all the functionality together.

**\_\_init\_\_**(*client*: GoodDataApiClient) → None

Take instance of GoodDataApiClient and return new GoodDataSdk instance.

Useful when customized GoodDataApiClient is needed. Usually users should use *GoodDataSdk.create* classmethod.

#### Methods

|                                                        |                                                                         |
|--------------------------------------------------------|-------------------------------------------------------------------------|
| <code>__init__(client)</code>                          | Take instance of GoodDataApiClient and return new GoodDataSdk instance. |
| <code>create(host_, token[, extra_user_agent_])</code> | Create common GoodDataApiClient and return new GoodDataSdk instance.    |

#### Attributes

|                                        |
|----------------------------------------|
| <code>catalog_data_source</code>       |
| <code>catalog_organization</code>      |
| <code>catalog_permission</code>        |
| <code>catalog_user</code>              |
| <code>catalog_workspace</code>         |
| <code>catalog_workspace_content</code> |
| <code>compute</code>                   |
| <code>insights</code>                  |
| <code>support</code>                   |
| <code>tables</code>                    |

```
classmethod create(host_: str, token_: str, extra_user_agent_: Optional[str] = None,  
                    **custom_headers_: Optional[str]) → GoodDataSdk
```

Create common GoodDataApiClient and return new GoodDataSdk instance. Custom headers are filtered. Headers with None value are removed. It simplifies usage because headers can be created directly from optional values.

This is preferred way of creating GoodDataSdk, when no tweaks are needed.

### 3.2.6 gooddata\_sdk.support

#### Classes

---

*SupportService*(api\_client)

---

#### gooddata\_sdk.support.SupportService

```
class gooddata_sdk.support.SupportService(api_client: GoodDataApiClient)
```

Bases: object

```
__init__(api_client: GoodDataApiClient) → None
```

#### Methods

---

```
__init__(api_client)
```

---

|                                                    |                                                        |
|----------------------------------------------------|--------------------------------------------------------|
| <i>wait_till_available</i> (timeout[, sleep_time]) | Wait till GD.CN service is available. When timeout is: |
|----------------------------------------------------|--------------------------------------------------------|

---

#### Attributes

---

|                     |                               |
|---------------------|-------------------------------|
| <i>is_available</i> | Checks if GD.CN is available. |
|---------------------|-------------------------------|

---

**property is\_available: bool**

Checks if GD.CN is available. Can raise exceptions in case of authentication or authorization failure.  
:return: True - available, False - not available

**wait\_till\_available**(timeout: int, sleep\_time: float = 2.0) → None

**Wait till GD.CN service is available. When timeout is:**

- > 0 exception is raised after given number of seconds.
- = 0 exception is raised whe service is not available immediately
- < 0 no timeout

Method propagates is\_available exceptions. :param timeout: seconds to wait to service to be available (see method description for details) :param sleep\_time: seconds to wait between GD.CN availability tests

### 3.2.7 gooddata\_sdk.table

#### Classes

|                                                   |                                                                                                               |
|---------------------------------------------------|---------------------------------------------------------------------------------------------------------------|
| <code>ExecutionTable(response, first_page)</code> | Represents execution result as a table.                                                                       |
| <code>TableService(api_client)</code>             | The TableService provides a convenient way to drive computations and access the results in a tabular fashion. |

#### gooddata\_sdk.table.ExecutionTable

**class** gooddata\_sdk.table.**ExecutionTable**(response: [ExecutionResponse](#), first\_page: [ExecutionResult](#))

Bases: object

Represents execution result as a table. This is a convenience wrapper for executions constructed using the following convention:

- all attributes are in the first dimension
- all metrics are in the second dimension
- if the execution is attribute- or metric-less, then there is always single dimension

The mapping to rows is then as follows:

- both attributes + metrics are on the execution = iteration over first dimension; as many rows as total records in the first dimension (paging.total[0])
- just attributes = iteration over just headers in first dimension; as many rows as total records in the first dimension (paging.total[0])
- just metrics = single row, all metrics values returned in one row

**\_\_init\_\_**(response: [ExecutionResponse](#), first\_page: [ExecutionResult](#)) → None

#### Methods

|                                             |                                                                     |
|---------------------------------------------|---------------------------------------------------------------------|
| <code>__init__(response, first_page)</code> |                                                                     |
| <code>read_all()</code>                     | Returns a generator that will be yielding execution result as rows. |

#### Attributes

|                              |                                                                                                                                                                       |
|------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>attributes</code>      |                                                                                                                                                                       |
| <code>column_ids</code>      | Returns column identifiers.                                                                                                                                           |
| <code>column_metadata</code> | Returns mapping of column identifier to definition of either attribute whose elements will be in that column or metric whose value will be calculated in that column. |
| <code>metrics</code>         |                                                                                                                                                                       |

**property column\_ids:** list[str]

Returns column identifiers. Each row will be a mapping of column identifier to column data.

**Returns**

**property column\_metadata:** dict[str, Union[Attribute, Metric]]

Returns mapping of column identifier to definition of either attribute whose elements will be in that column or metric whose value will be calculated in that column. :return:

**read\_all()** → Generator[dict[str, Any], None, None]

Returns a generator that will be yielding execution result as rows. Each row is a dict() mapping column identifier to value of that column.

**Returns**

generator yielding dict() representing rows of the table

### **gooddata\_sdk.table.TableService**

**class gooddata\_sdk.table.TableService**(api\_client: GoodDataApiClient)

Bases: object

The TableService provides a convenient way to drive computations and access the results in a tabular fashion.

Compared to the ComputeService, with this one here you do not have to worry about the layout of the result and do not have to have to work with execution response, access the data using paging.

The ExecutionTable returned by the TableService allows you to iterate over the rows of the calculated data.

**\_\_init\_\_**(api\_client: GoodDataApiClient) → None

#### **Methods**

---

**\_\_init\_\_**(api\_client)

---

**for\_insight**(workspace\_id, insight)

---

**for\_items**(workspace\_id, items[, filters])

---

## **3.2.8 gooddata\_sdk.type\_converter**

### **Functions**

---

**build\_stores**()

Initialize both AttributeConverterStore and DBTypeConverterStore with Convertors.

---

**gooddata\_sdk.type\_converter.build\_stores**

`gooddata_sdk.type_converter.build_stores()` → None

Initialize both `AttributeConverterStore` and `DBTypeConverterStore` with Convertors.

**Classes**

|                                               |                                                                                                              |
|-----------------------------------------------|--------------------------------------------------------------------------------------------------------------|
| <code>AttributeConverterStore()</code>        | Store for conversion of attributes                                                                           |
| <code>Converter()</code>                      | Base Converter class.                                                                                        |
| <code>ConverterRegistryStore()</code>         | Class store <code>TypeConverterRegistry</code> instances for each registered type.                           |
| <code>DBTypeConverterStore()</code>           | Store for conversion of database types                                                                       |
| <code>DateConverter()</code>                  |                                                                                                              |
| <code>DatetimeConverter()</code>              |                                                                                                              |
| <code>IntegerConverter()</code>               |                                                                                                              |
| <code>StringConverter()</code>                |                                                                                                              |
| <code>TypeConverterRegistry(type_name)</code> | Class stores converters for given type with ability to distinguish converters based on sub-type granularity. |

**gooddata\_sdk.type\_converter.AttributeConverterStore**

**class** `gooddata_sdk.type_converter.AttributeConverterStore`

Bases: `ConverterRegistryStore`

Store for conversion of attributes

`__init__()`

**Methods**

|                                                                |                                                                                                        |

| <code>__init__()</code>                                        |                                                                                                        |
| <code>find_converter(type_name[, sub_type])</code>             | Find Converter for given type and sub type.                                                            |
| <code>register(type_name, class_converter[, sub_types])</code> | Register Converter instance created from provided Converter class to given type and list of sub types. |
| <code>reset()</code>                                           | Reset converters setup                                                                                 |

**classmethod** `find_converter(type_name: str, sub_type: Optional[str] = None)` → `Converter`

Find Converter for given type and sub type. :param type\_name: type name :param sub\_type: sub type name

**classmethod** `register(type_name: str, class_converter: Type[Converter], sub_types: Optional[list[str]] = None)` → None

Register Converter instance created from provided Converter class to given type and list of sub types. When sub types are not provided, converter is registered as the default one for given type. :param type\_name:

type name :param class\_converter: Converter class :param sub\_types: list of sub types or None (default type Converter)

**classmethod reset()** → None

Reset converters setup

### **gooddata\_sdk.type\_converter.Converter**

**class gooddata\_sdk.type\_converter.Converter**

Bases: object

Base Converter class. It defines Converter API and implements support for external type conversion. External type conversion provides ability to plug-in conversion function to Converter

**\_\_init\_\_()**

#### **Methods**

---

*\_\_init\_\_()*

---

db\_data\_type()

---

set\_external\_fnc(fnc)

---

to\_external\_type(value)

---

to\_type(value)

---

#### **Attributes**

---

DEFAULT\_DB\_DATA\_TYPE

---

### **gooddata\_sdk.type\_converter.ConverterRegistryStore**

**class gooddata\_sdk.type\_converter.ConverterRegistryStore**

Bases: object

Class store TypeConverterRegistry instances for each registered type. It provides interface to register converters with type and sub-type and to find converter. The class is not meant to be used directly but as base class for child classes

**\_\_init\_\_()**

## Methods

---

|                                                                |                                                                                                        |
|----------------------------------------------------------------|--------------------------------------------------------------------------------------------------------|
| <code>__init__()</code>                                        |                                                                                                        |
| <code>find_converter(type_name[, sub_type])</code>             | Find Converter for given type and sub type.                                                            |
| <code>register(type_name, class_converter[, sub_types])</code> | Register Converter instance created from provided Converter class to given type and list of sub types. |
| <code>reset()</code>                                           | Reset converters setup                                                                                 |

---

**classmethod** `find_converter(type_name: str, sub_type: Optional[str] = None) → Converter`

Find Converter for given type and sub type. :param type\_name: type name :param sub\_type: sub type name

**classmethod** `register(type_name: str, class_converter: Type[Converter], sub_types: Optional[list[str]] = None) → None`

Register Converter instance created from provided Converter class to given type and list of sub types. When sub types are not provided, converter is registered as the default one for given type. :param type\_name: type name :param class\_converter: Converter class :param sub\_types: list of sub types or None (default type Converter)

**classmethod** `reset() → None`

Reset converters setup

## gooddata\_sdk.type\_converter.DBTypeConverterStore

**class** `gooddata_sdk.type_converter.DBTypeConverterStore`

Bases: `ConverterRegistryStore`

Store for conversion of database types

`__init__()`

## Methods

---

|                                                                |                                                                                                        |
|----------------------------------------------------------------|--------------------------------------------------------------------------------------------------------|

| <code>find_converter(type_name[, sub_type])</code>             | Find Converter for given type and sub type.                                                            |
| <code>register(type_name, class_converter[, sub_types])</code> | Register Converter instance created from provided Converter class to given type and list of sub types. |
| <code>reset()</code>                                           | Reset converters setup                                                                                 |

---

**classmethod** `find_converter(type_name: str, sub_type: Optional[str] = None) → Converter`

Find Converter for given type and sub type. :param type\_name: type name :param sub\_type: sub type name

**classmethod** `register(type_name: str, class_converter: Type[Converter], sub_types: Optional[list[str]] = None) → None`

Register Converter instance created from provided Converter class to given type and list of sub types. When sub types are not provided, converter is registered as the default one for given type. :param type\_name: type name :param class\_converter: Converter class :param sub\_types: list of sub types or None (default type Converter)

**classmethod** `reset()` → None  
Reset converters setup

### `gooddata_sdk.type_converter.DateConverter`

**class** `gooddata_sdk.type_converter.DateConverter`

Bases: *Converter*

`__init__()`

#### Methods

---

`__init__()`

---

`db_data_type()`

---

`set_external_fnc(fnc)`

---

|                             |                                                               |
|-----------------------------|---------------------------------------------------------------|
| <code>to_date(value)</code> | Add first month and first date to incomplete iso date string. |
|-----------------------------|---------------------------------------------------------------|

---

`to_external_type(value)`

---

`to_type(value)`

---

#### Attributes

---

`DEFAULT_DB_DATA_TYPE`

---

**classmethod** `to_date(value: str)` → date

Add first month and first date to incomplete iso date string.

```
>>> assert DateConverter.to_date("2021-01") == date(2021, 1, 1)
>>> assert DateConverter.to_date("1992") == date(1992, 1, 1)
```

### `gooddata_sdk.type_converter.DatetimeConverter`

**class** `gooddata_sdk.type_converter.DatetimeConverter`

Bases: *Converter*

`__init__()`

## Methods

---

`__init__()`

---

`db_data_type()`

---

`set_external_fnc(fnc)`

---

`to_datetime(value)` Append minutes to incomplete datetime string.

---

`to_external_type(value)`

---

`to_type(value)`

---

## Attributes

---

`DEFAULT_DB_DATA_TYPE`

---

**classmethod** `to_datetime(value: str) → datetime`

Append minutes to incomplete datetime string.

```
>>> from datetime import datetime
>>> assert DatetimeConverter.to_datetime("2021-01-01 02") == datetime(2021, 1, 1, 2, 0)
>>> assert DatetimeConverter.to_datetime("2021-01-01 12:34") == datetime(2021, 1, 1, 12, 34)
```

### `gooddata_sdk.type_converter.IntegerConverter`

**class** `gooddata_sdk.type_converter.IntegerConverter`

Bases: `Converter`

`__init__()`

## Methods

---

`__init__()`

---

`db_data_type()`

---

`set_external_fnc(fnc)`

---

`to_external_type(value)`

---

`to_type(value)`

---

## Attributes

---

DEFAULT\_DB\_DATA\_TYPE

---

## gooddata\_sdk.type\_converter.StringConverter

**class** gooddata\_sdk.type\_converter.StringConverter

Bases: *Converter*

**\_\_init\_\_**()

## Methods

---

*\_\_init\_\_*()

---

db\_data\_type()

---

set\_external\_fnc(fnc)

---

to\_external\_type(value)

---

to\_type(value)

---

## Attributes

---

DEFAULT\_DB\_DATA\_TYPE

---

## gooddata\_sdk.type\_converter.TypeConverterRegistry

**class** gooddata\_sdk.type\_converter.TypeConverterRegistry(*type\_name: str*)

Bases: object

Class stores converters for given type with ability to distinguish converters based on sub-type granularity.

**\_\_init\_\_**(*type\_name: str*)

Initialize instance with type for which instance is going to be responsible :param type\_name: type name

## Methods

|                                            |                                                                                                         |
|--------------------------------------------|---------------------------------------------------------------------------------------------------------|
| <code>__init__(type_name)</code>           | Initialize instance with type for which instance is going to be responsible :param type_name: type name |
| <code>converter(sub_type)</code>           | Find and return converter instance for a given sub-type.                                                |
| <code>register(converter, sub_type)</code> | Register converter instance for given sub-type (granularity).                                           |

**converter**(*sub\_type: Optional[str]*) → *Converter*

Find and return converter instance for a given sub-type. Default converter instance is returned if the sub-type is not found or not provided. When a default converter is not registered, ValueError exception is raised.  
:param sub\_type: sub-type name :return: Converter instance

**register**(*converter: Converter, sub\_type: Optional[str]*) → None

Register converter instance for given sub-type (granularity). If sub-type is not specified, converter is registered as the default one for the whole type. Default converter can be registered only once. :param converter: converter instance :param sub\_type: sub-type name

## 3.2.9 gooddata\_sdk.utils

### Functions

|                                                            |                                                                                     |
|------------------------------------------------------------|-------------------------------------------------------------------------------------|
| <code>camel_to_snake(camel_case_str)</code>                |                                                                                     |
| <code>change_case(dictionary, case)</code>                 |                                                                                     |
| <code>change_case_helper(value, case)</code>               |                                                                                     |
| <code>create_directory(path)</code>                        |                                                                                     |
| <code>get_sorted_yaml_files(folder)</code>                 |                                                                                     |
| <code>id_obj_to_key(id_obj)</code>                         | Given an object containing an id+type pair, this function will return a string key. |
| <code>load_all_entities(get_page_func[, page_size])</code> | Loads all entities from a paged resource.                                           |
| <code>load_all_entities_dict(get_page_func[, ...])</code>  |                                                                                     |
| <code>read_layout_from_file(path)</code>                   |                                                                                     |
| <code>snake_to_camel(snake_case_str)</code>                |                                                                                     |
| <code>write_layout_to_file(path, content)</code>           |                                                                                     |

**gooddata\_sdk.utils.camel\_to\_snake**

`gooddata_sdk.utils.camel_to_snake(camel_case_str: str) → str`

**gooddata\_sdk.utils.change\_case**

`gooddata_sdk.utils.change_case(dictionary: dict, case: Callable[[str], str]) → dict`

**gooddata\_sdk.utils.change\_case\_helper**

`gooddata_sdk.utils.change_case_helper(value: Union[list, dict, str], case: Callable[[str], str]) → Union[list, dict, str]`

**gooddata\_sdk.utils.create\_directory**

`gooddata_sdk.utils.create_directory(path: Path) → None`

**gooddata\_sdk.utils.get\_sorted\_yaml\_files**

`gooddata_sdk.utils.get_sorted_yaml_files(folder: Path) → list[Path]`

**gooddata\_sdk.utils.id\_obj\_to\_key**

`gooddata_sdk.utils.id_obj_to_key(id_obj: Union[str, ObjId, Dict[str, Dict[str, str]], Dict[str, str]]) → str`

Given an object containing an id+type pair, this function will return a string key.

For convenience, this also recognizes the *ref* format used by GoodData.UI SDK. In that format, the id+type are wrapped in ‘identifier’.

**Parameters**

**id\_obj** – id object

**Returns**

string that can be used as key

**gooddata\_sdk.utils.load\_all\_entities**

`gooddata_sdk.utils.load_all_entities(get_page_func: functools.partial[Any], page_size: int = 500) → AllPagedEntities`

Loads all entities from a paged resource. The primary input to this function is a partial function that is setup with all the fixed parameters. Given this the function will get entities page-by-page and merge them into a single ‘pseudo-response’ containing data and included attributes.

An example usage:

```
>>> import functools
>>> import gooddata_metadata_client as metadata_client
>>> import gooddata_metadata_client.apis as metadata_apis
>>> api = metadata_apis.EntitiesApi(metadata_client.ApiClient())
```

(continues on next page)

(continued from previous page)

```
>>> get_func = functools.partial(api.get_all_entities_visualization_objects, 'some-
↳workspace-id',
>>>                                     include=["ALL"], _check_return_type=False)
>>> vis_objects = load_all_entities(get_func)
```

**Parameters**

- **get\_page\_func** – an API controller from the metadata client
- **page\_size** – optionally specify page length, default is 500

**Returns****gooddata\_sdk.utils.load\_all\_entities\_dict**

`gooddata_sdk.utils.load_all_entities_dict`(*get\_page\_func: functools.partial[Any], page\_size: int = 500, camel\_case: bool = False*) → dict[str, Any]

**gooddata\_sdk.utils.read\_layout\_from\_file**

`gooddata_sdk.utils.read_layout_from_file`(*path: Path*) → Any

**gooddata\_sdk.utils.snake\_to\_camel**

`gooddata_sdk.utils.snake_to_camel`(*snake\_case\_str: str*) → str

**gooddata\_sdk.utils.write\_layout\_to\_file**

`gooddata_sdk.utils.write_layout_to_file`(*path: Path, content: Union[dict[str, Any], list[dict]]*) → None

**Classes**

---

*AllPagedEntities*(data, included)

---

*SideLoads*(objs)

---

**gooddata\_sdk.utils.AllPagedEntities**

**class** `gooddata_sdk.utils.AllPagedEntities`(*data, included*)

Bases: tuple

`__init__`()

## Methods

---

## Attributes

---

|                       |                          |
|-----------------------|--------------------------|
| <code>data</code>     | Alias for field number 0 |
| <code>included</code> | Alias for field number 1 |

---

**count**(*value*, /)

Return number of occurrences of value.

**property data**

Alias for field number 0

**property included**

Alias for field number 1

**index**(*value*, *start*=0, *stop*=9223372036854775807, /)

Return first index of value.

Raises ValueError if the value is not present.

## gooddata\_sdk.utils.SideLoads

**class** gooddata\_sdk.utils.**SideLoads**(*objs*: list[Any])

Bases: object

**\_\_init\_\_**(*objs*: list[Any]) → None

## Methods
